

SYLLABUS DEL CORSO

Analisi Esplorativa

1920-2-E4102B084-E4102B084M

Learning objectives

The Exploratory Analysis module introduces the main descriptive statistical methods addressed to study two or more variables jointly observed on a set of statistical units. These methods aim at exploring multidimensional data to detect underlying structures and reduce their dimensionality, however preserving the main observed features. From a practical point of view, data analysis is carried out through the R software (RStudio environment).

Knowledge and understanding. This course will provide expertise and understanding concerning:

- _____
- the practical application of the exploratory techniques through numerical exercises to be solved with the pocket calculator (i.e., without using statistical software)
- the logic and working of the R language and its use in the application of the main statistical analyses for multidimensional data and the related graphical representations
- the reading and interpretation of the analysis outputs produced by the R software.

Ability to apply knowledge and understanding. At the end of the course, the students will be able to:

- _____
- reduce the dimensionality of a dataset by aggregating the statistical units into groups and setting up summary indicators of the observed variables
- interpret and compare the results of the analyses obtained with different methods to establish which approach should be considered most appropriate according to specific, a priori fixed criteria

- import external data files of different sources and formats into R and autonomously use the basic syntax of the R language.
-

Contents

Introduction to multivariate statistical analysis. Quantitative, qualitative and mixed data matrices. Graphical representations of multidimensional data. Cluster Analysis: Hierarchical and non-hierarchical clustering methods. Principal component analysis. Exploratory factor analysis. Integrated use of exploratory multivariate methods. Applications to real data with software R (RStudio environment).

Detailed program

- Introduction to the multivariate statistical analysis: French and Anglo-Saxon schools, classification of multivariate analysis methods
- Quantitative, qualitative and mixed-type data matrices. Main syntheses and transformations. Data representation, individual space, and variable space. Dissimilarities and distances between units, distances between variables
- Cluster Analysis: Hierarchical and non-hierarchical clustering methods, goodness of classification, applications to quantitative and qualitative variables
- Principal component analysis: Extraction of the principal components, stopping criteria, evaluation of the reproduced variability, interpretation of the principal components, applications
- Exploratory Factor Analysis: Factor model, study of correlations, factor extraction methods, factor rotation, factor scores, applications
- Integrated use of exploratory multivariate techniques
- Analyses of empirical cases with RStudio

Prerequisites

Passing of preliminary examinations of Calculus, Linear Algebra, Probability, Statistics I

Teaching methods

Theoretical lectures in the classroom and practical exercises in the statistical-informatics laboratory with the R software (RStudio environment)

Assessment methods

The exam consists of a written test (total duration: 2 hours) with three questions (divided into several points) that deal with both the theoretical and applicative aspects of the methodologies covered in the course. A fourth question is optional and concerns programming with R software. _____

The oral exam is optional (on request by the professor or student) and covers both theoretical and practical topics. Access to the oral test is subject to passing the written test with a mark of at least 18/30. It should be noted that the oral test may involve either the increase, the maintenance, or the decrease in the evaluation achieved in the written test.

Textbooks and Reading Materials

- Teaching material uploaded on the course e-learning website
- Frosini, B.V. (2014). Complementi di analisi statistica multivariata, EDUCatt, Milano
- Zani, S., Cerioli, A. (2007). Analisi dei dati e data mining per le decisioni aziendali, Giuffrè Editore, Milano
- Bolasco, S. (1999). Analisi multidimensionale dei dati: strategie e criteri di interpretazione, Carocci, Roma
- Dillon, W.R., Goldstein, M. (1984). Multivariate Analysis, J. Wiley, New York
- Everitt, B.S., Hothorn, T. (2011). An Introduction to Applied Multivariate Analysis with R, Springer, Berlin

Semester

First semester, second period

Teaching language

Italian
