SYLLABUS DEL CORSO

L'assistenza Infermieristica alle Persone Portatrici di Stomia

1920-2-I0101D120

Aims

General objective: description of nurse activity at people with an ostomy

Specific objectives:

1. stoma and skin care;
2. know and manage the early and late complications through the presentation of clinical cases
3. know every step of the therapeutic project that involves people with an ostomy and their caregivers

Contents

STOMA-CARE is a nursing discipline dedicated to the management of ostomy:

- packaging techniques,
- therapeutic education (pre-, post-surgery, hospital discharge, at home)
- choosing the right device
- stoma care
- prevention of early and late complications

The nursing figure is the reference point for people with ostomies and health workers and / or caregivers who wish to deepen their knowledge and skills.

The topic "ostomy" has often been poorly treated and consequently inadequate attention was given to patients who carried it; such patients were therefore forced to live in silence and isolation their condition of "ostomy", with all the negative consequences, both psychological and practical, that could derive from them.

In recent years, the stomatherapy is becoming increasingly widespread thanks to the presence of health professionals specialized in the sector and the birth of specific clinics both at the main hospitals and on the territory. Particular relevance to enterostomies and notes about urinary ostomy.

Detailed program

outline of anatomy and pathophysiology and packaging techniques

stoma-care and the selection of the right device

therapeutic education (pre-, post-surgery, hospital discharge, at home)

prevention of early and late complications

Prerequisites

2nd-3rd year

Teaching form

Lectures; plenary discussion; practical demonstration
