COURSE SYLLABUS

Protein Kinase Inhibitors in Oncohaematology

2021-4-H4101D050

Aims

Lessons aim to provide students with biological and clinical information on the use of Tyrosine Kinase Inhibitors (TKI) in solid and hematological neoplasias.

Contents

Use of TKI and resistance mechanisms.

Detailed program

Lessons aim to provide students with hematological key elements such as:

- different TKI in use or in development;
- their mechanisms of action;
- mechanisms of resistance to TKI.

The neoplasias described will include: Chronic Myeloid Leukemia, ALK+ lymphomas, GIST, Lung cancer subtypes.

Prerequisites

Student must know biologic, molecular and cellular bases that can impact hematological diseases.

Teaching form

Lessons in attendance and journal club of selected papers.

Textbook and teaching resource**Semester**

II semester

Assessment method

Critical discussion of papers.
