SYLLABUS DEL CORSO

Physiology of The Nervous System I

2021-4-H4102D028-H4102D102M

Aims

The aim of this course is to provide basic concepts and knowledge on the neurosciences. The student will be introduced to the main categories of disorders of the nervous system, focusing mainly on the physio-pathological mechanisms. This course has been designed to cover basic functional aspects of the central nervous system. At the end of the Neuroscience 1 and Neuroscience 2 courses, the students should be able to summarize our understanding of the functional organization of the human brain.

Contents

The course will explore the neuroanatomical and neurophysiological basis of the spinal cord, the brainstem, the visual perception, the auditory perception, the vestibular functions.

Detailed program

- Spinal Reflexes: during normal movements the central nervous system uses information from a vast array of sensory receptors to ensure the generation of the correct pattern of muscle activity; The Control of Gaze: as we explore the world around us these motor systems act to stabilize our body, particularly our eyes, in space.

- Brain Stem, Reflexive Behavior, and the Cranial Nerves: we shall review the cranial nerves and their origin in the brain stem as well as the ensembles of local circuit neurons in the brain stem that organize the simple behaviors involving the face and head

- Brain Stem Modulation of Sensation and Movement: we will examine the groups of interneurons surrounding

cranial nerve nuclei in the reticular formation of the brain stem. These reticular interneurons have local projections that mediate reflexes and simple stereotyped behaviors, such as chewing and swallowing. In this chapter we shall explore the long projection systems of the reticular formation

- Visual Processing by the Retina: visual perception begins in the retina and occurs in two stages. Light entering the cornea is projected onto the back of the eye, where it is converted into an electrical signal by a specialized sensory organ, the retina. These signals are then sent through the optic nerve to higher centers in the brain for further processing necessary for perception; Constructing the Visual Image, Central Visual Pathways, Perception of Motion, Depth, and Form, Color Vision: the brain recognizes form, motion, depth, and color using strategies that no computer can achieve.

- Hearing, Sensory Transduction in the Ear, The Vestibular System: human experience is enriched by our ability to distinguish a remarkable range of sounds—from the complexity of a symphony, to the warmth of a conversation, to the dull roar of the stadium. This ability depends upon the almost miraculous feats of hair cells, the receptors of the internal ear. Similar hair cells are also responsible for our sense of equilibrium. Human hearing commences when the cochlea, the snail-shaped receptor organ of the inner ear, transduces sound energy into electrical signals and forwards them to the brain.

Prerequisites

Sound knowledge of anatomy and biochemistry

Teaching form

The teaching methods will include lectures, videos, and class discussions.

In the first semester the courses will be delivered in mixed mode from asynchronous remote with synchronous videoconferencing events (WEBEX)

Textbook and teaching resource

- Dale Purves, George J. Augustine, David Fitzpatrick, William C. Hall, Anthony-Samuel LaMantia, Richard D. Mooney, Michael L. Platt, Neuroscience (6th Edition) – eBook - Sinauer Associates (Oxford University Press); 6th edition

- E. R. Kandel, J. H. Schwartz, T. M. Jessel, S. A. Siegelbaum, A. J. Hudspeth, Principles of neural science, Mc Graw Hill Medical

- Susan E. Mulroney, Adam Myers, Netter's Essential Physiology, Elsevier

Semester

First semester

Assessment method

There will be ongoing test.

The exam consists in a written test. Open questions will be posed to the student in order to evaluate the general knowledge of the topics. Moreover, the student will be asked to answer to questions that require the analysis of a complex phenomenon, its rationalization and the application of specific physiology principles and to solve simple exercises. Finally, a clinical case may be presented which will require the analysis of the interconnections between different physiological variables in the light of the theoretical paradigms.

Exams written remotely, unless otherwise indicated by the teacher, will be provided by the platform https://esamionline.elearning.unimib.it, access to which will be activated for the date and time of the exam.

Office hours

By appointment, subject to notification to be sent to giulio.sancini@unimib.it
