DEGLI STUDI DI MILANO-BICOCCA

COURSE SYLLABUS

Physics III

2021-2-E3001Q043

Aims

Illustrations of phenomena that show the inadequacy of classical physics theories for their description, formulation of new models that introduce the students to the first concept leading to quantum physics.

Contents

Atomic mature of matter (Maxwell-Boltzmann distribution) **and of charge** (e/m by Thompson, Zeeman, e determination for Millikan).

Non classical behaviour of e.m. radiation. Black body and Planck hypothesis about e.m. oscillator quantization. Photoelectric effect and Einstein hypothesis about the photon. Application of Planck oscillator to the specific heat of solids: Einstein and Debye models.

Atomic models: Rutherford coulombian scattering, atomic spectra, Bohr model, Sommerfeld model. Elements of magnati properties of atoms.

E.M. waves or photons? X rays, Compton effect.

Particles or waves? De Broglie relation, electron diffraction by a crystal.

Detailed program

Kinetic theory of gases, Equipartition of energy: success and faults. C_v solids and of diatomic gases. Maxwell distribution for the modulus of the molecular velocity. Molecular effusion, Thermal Doppler broadening, Boltzmann factor, notes on classical statistical distribution. Mean free path for gases, transport coefficients: viscosity nd thermal conductibility. Brownian motion.

Elementary charge.: electrolysis (faraday), e/m estimate (Thomson) classical Zeeman effect. Estimate of the elementary charge (Milikan). Thomson Parabolas foe positive ions, Isotopes.

Thermal radiation and Black body. Kirchoff law, Isotropy of thermal radiation, Law of Stefan-Boltzmann, BB thermodynamics, radiation pressure. Wien law, Rayleigh-Jeans model for BB, Planck model, harmonic oscillator energy quantum theory.

Specific heat of solids: Einstein model and Debye model.

Photoelectric effect: the theory of Einstein and the photon.

Atomic models: Thomson, scattering of alpha particles, Rutherford model for columbian scattering. Bohr model: postulates, orbits, energy of levels, atomic series. Franck-Hertz experiment, recoil effects. Quantization rules of Wilson-Sommerfeld (particles in a box, 1D, 3D, levels degeneration). Magnetic properties of atoms, Stern and Gerlach experiment.

X rays: production, continuum spectrum, Moseley law, Bragg law for diffraction. Thomson cross section for the electron, Compton effect, pair production.

De Broglie hypothesis. Electron diffraction: Davisson and Germer experiment.

Heisenberg Uncertainty principle: typical applications and double slit experiment.

Prerequisites

The contents of the maths and physics courses of the first three semesters of the Bachelor degree in Physics and Mathematics

Teaching form

Lectures

In case of Covid-19 emergency, lessons will be online, partially in streaming. In anycase, weekly webconference meetimng with students will be performed. Videos of the lessons will be available.

Textbook and teaching resource

Selected chapters in the following texts and lecturer’s notes.

TIPLER “Modern Physics”

Cap.2 – The kinetic theory of matter

Cap 4 – The Nuclear atom

BARROW “Chimica fisica”

Cap. 2 - teoria cinetica

ENGE-WEHR-RICHARDS “Introduction to Atomic Physics”

Cap. 2 - the atomic view of electricity

Cap. 3 - the atomic view of radiation

DEKKER – “Solid State Physics”

Cap. 2 – the specific heat of solids and lattice vibrations

SERWAY-MOSES-MOYER “Modern Physics”

Cap.5 – matter waves

RICHTMYER-KENNARD-COOPER “Modern Physics”

Cap. 7 - X-rays

EISBERG-RESNICK “Quantum Physics”

Cap. 4 – Bohr’s model of the atom

ALONSO – FINN “III-Quantum and statistical physics”

Cap. 10 - classical statistical mechanics

Semester

II semester

Assessment method

The assessment is reached through a written exam that last three hours, with open questions (4/5) in which the student is requested to expose a topic of the program with small derivations, graphs and, if needed some numerical estimates. The use of a scientific calculator is requested. Access to textbooks during the exam is strictly forbidden. The exam score is expressed in 30 points units.

The student succeeded in a positive written exam (>=18/30) can perform an optional oral exam or keep the rating obtained in the written one.

Those students that have been rated 16/30 and 17/30 in the written exam access the oral exam in order to obtain a final score >=18/30.

In the event of Covid-19 emergency, the lecturer might change the assessment method by introducono either an

oral (online) session or a multiple-choice written exam followed by an oral one.

Office hours

By appointment
