

UNIVERSITÀ
DEGLI STUDI DI MILANO-BICOCCA

COURSE SYLLABUS

Computer Science and Maths Laboratory

2021-1-E3501Q066

Aims

This course aims at introducing the basic *knowledge* of computer systems architecture and networks, as well as different programming paradigms. Moreover, the course will provide *competencies* to identify algorithms to solve simple problems and implementing them into the Java Programming Language, according to the imperative programming paradigm.

Contents

Von Neumann's Model of Calculators. Components and functionalities of operating systems. Introduction to Computer Networks. Programming Languages. Structured Programming in Java.

Detailed program

Architecture of Calculators

- The Von Neumann model and basic notions on information representation
- Introduction to Operating Systems
- Basic notions of Computer Networks

Structured Programming in Java

- Programming languages and translators taxonomy
- The Java Virtual Machine
- Algorithms and programs
- Primitive Data types in Java.
- Flow Control in Java
- Arrays of Primitive Data Types
- Methods in Java: definition and invocation
- Introduction to recursive algorithm design and implementation

Prerequisites

Nothing

Teaching form

- Lessons, 4 credits
- Laboratory, 2 credits

During the COVID-19 pandemic emergency, lessons will be delivered according to a blended learning approach, exploiting both synchronous and asynchronous recorded lessons. Face to face lessons will be recorded too and shared at distance.

Textbook and teaching resource

All the information about the course as well as the lessons slides and practical exercises will be available through the learning platform of the University, at the elearning.unimib.it link.

The suggested textbook will be:

W. Savitch: "Programmazione di base e avanzata con Java", a cura di Daniela Micucci, 2nd edition, Pearson

Semester

Second semester

Assessment method

Examination type

Written and Oral examination; the oral examination is not mandatory, but necessary to obtain a "cum laude" merit. The mark range is 18-30/30. The oral examination is about both theoretical questions and practical exercises and can increase the result of written examination by at most 4 points.

During COVID-19 pandemic emergency, oral examinations will only be at distance. They will be accomplished through WebEx platform, and a link to the public session will be posted on the course e-learning page.

Detailed information about written examinations will follow.

The written examination is divided into two parts: the first one is devoted to evaluate theoretical skills about structured programming, by means of a collection of close-ended questions; the second one concerns the design and implementation of a simple software program, with the aim to demonstrate the student's capability to solve correctly a simple practical problem, on the basis of programming principles considered during the course, without generating any kind of error (i.e. compile time, runtime, logical errors).

The arithmetic mean (possibly weighted) of the two marks defines the final mark proposed to the student: in case it is sufficient, the student can accept it as is or modify it by means of an oral examination (possibly decreasing the final mark). Oral examination is possible if and only if written examination is sufficient. The teacher has the faculty to establish mandatory oral examinations for those students whose written examinations, although sufficient, present some criticalities: for example, in case of not sufficient theoretical questions whereas practical exercises are good, or viceversa.

Five exam sessions are stated: June, July, September, November and January; moreover two partial examinations are proposed to students during the course.

Office hours

Thursday, between 11 a.m. and 12 a.m., or by appointment.

During COVID-19 pandemic emergency, students will be received at distance, through WebEx platform, on students' request as well as teacher's proposal.
