DEGLI STUDI DI MILANO-BICOCCA

## SYLLABUS DEL CORSO

### Physics of The Sea

2021-1-F7502Q005

---

#### Aims

Provide basic knowledge of the physics of the oceans. Show the usefulness of mathematical and physical models for the description and the understanding of geophysical fluid dynamics.

#### Contents

In the first part of the course fundamental physical properties of the ocean will be introduced. The second part will be basic geophysical fluid dynamics, with the discussion of solutions to approximations relevant for the description of the ocean circulation and waves. In the laboratory sessions, experiments and problems will be presented to better visualise and understand the main topics of the course.

#### Detailed program

*Ocean Physics:* Light and sound propagation. Temperature and salinity. Equation of state. Mixed layer and stratification. Tracer distribution. Heat fluxes. Water masses. T-S diagrams.

*Oceanic Dynamics:* Navier-Stokes equation. Mass conservation. Hydrostatic approximation. Geostrophic flow. Ekman transport. Upwelling and downwelling. Vorticity. Large scale circulation and winds. Subtropical and subtropical gyres. Western boundary currents. Gravity waves. Rossby and Kelvin waves. Turbulent fluxes.

*Laboratory sessions:* Geophysical fluid dynamical experiments. Oceanographic problem solving.

## **Prerequisites**

None

## **Teaching form**

Online frontal lecture

Lab

---

## **Textbook and teaching resource**

---

Stewart, "Introduction to Physical Oceanography", freely available on line.

Marshall and Plumb "Atmosphere, Ocean, and Climate Dynamics", Academic Press (2008)

## **Semester**

First

## **Assessment method**

Online oral exam: candidates will be asked questions regarding the topics discussed in class.

During the COVID-19 emergency oral exams will be online, through the Webex platform. A public link will be provided on the elearning webpage.

## **Office hours**

Contact the instructor
