

UNIVERSITÀ
DEGLI STUDI DI MILANO-BICOCCA

SYLLABUS DEL CORSO

Sostenibilità Energetica

2021-1-F1701Q142

Aims

Analysis of energetic aspects connected with the use of energetic resources and with the energetic sustainability referred to global and local contexts.

Contents

Thermodynamics

Thermal machines

Refrigeration Machine

Energy Saving

Global energy system

Environmental effects of energy consumption

Detailed program

Thermodynamics

- Concept of temperature and of thermodynamic system
- First law of thermodynamics: the conservation of energy
- Enthalpy and its application to thermal reactions
- Second law of thermodynamics: reversibility and irreversibility
- Entropy function and its evolution
- Thermodynamic efficiency

Thermal machines

- Internal combustion engines
 - Otto cycle (gasoline engine)
 - Diesel cycle
- Brayton cycle (turbine engine)
- Fuels for internal combustion engines
- External combustion engines
- Rankine cycle
- Cogeneration systems
- Optimization of the thermal machines

Refrigeration Machine

- Cooling performance coefficient
- Cooling cycles
- Refrigerant gasses
- Heat pumps
- Geothermal application of heat pumps
- Trigeration systems

Energy Saving

- Energy saving strategies
- Determination of energy efficiencies in various technological applications
- Dispersion of heat
- Methods for efficient use of energy
- Comparison between different technologies for energy saving

Global energy system

- Global energy balance
- Distribution of energy consumption
- Evolution of energy consumption
- Energy requests by their possible applications
- Peculiar aspects of global energy consumption
- Peculiar aspects of energy consumption in Italy

Environmental effects of energy consumption

- Earth's radiation balance
- Temperature on Earth
- Earth atmosphere and greenhouse effect
- Possible reasons of the global warming

- Radiative forcing
- Global effect on Earth climate changes
- Strategies to mitigate the global warming

Prerequisites

Basic knowledge of the three-year degree in physics

Teaching form

Lectures.

Some seminars on specific arguments will be organized as parts of the course program.

During the COVID-19 emergency period the course will be delivered remotely with synchronous online lessons. In any case, lessons will be recorded and made available on the e-learning platform

Textbook and teaching resource

Egbert Boeker and Rienk Van Grondelle - Environmental Physics: Sustainable Energy and Climate Change (3rd edition)

David JC MacKay - Sustainable Energy — without the hot air

B. Botkin, E. Keller - Environmental Science: Earth as a Living Planet (8th edition)

During the course some bibliographic references will be indicated and some lecture notes will be available

Semester

Second semester

Assessment method

Oral examination - No intermediate evaluation will be organized

- Discussion on argument presented during the course
- Analysis on some aspects related to production and use of energy
- Description of possible approaches connected with energy sustainability

Office hours

Monday - Friday by appointment
