COURSE SYLLABUS

Plasma Physics I

2021-1-F1701Q090

Aims

Aims

Teaching the principles of plasma physics:

Kinetic and fluid models for plasmas applications to the study of wave-plasma interaction.

Magnetohydrodynamic equations for the study of the stability of magnetized plasmas and magnetohydrodynamic (MHD) instability in linear and toroidal plasmas.

Introduction to models of the plasmas produced for applications (kinetics in gas phase and surface phase, sheaths and sources)

Contents

Contents

Fundamentals of plasma physics: kinetic and fluid plasma models, wave-plasma interaction by fluid model and kinetic model, magnetohydrodynamic equations, magneto-hydrodynamic stability and instabilities, magnetic reconnection, introduction to plasma applications.

Detailed program

Detailed program

Kinetic and fluid descriptions of plasma: the distribution function, the Vlasov equation, the moments of the distribution function, the fluid equations, MHD and instabilities: space and time scales. Waves in Plasma: Introduction to the wave propagation in plasma, Linearization of the Maxwell equations and fluid equations; Waves in non magnetised plasma; Langmuir oscillations; Electromagnetic transverse waves; Pressure effects; Waves in a magnetised plasma: perpendicular and parallel propagations; Wave polarisation in plasma; Waves in a drifting plasma: two stream instability. Kinetics description of waves: Landau Damping. MHD and Instabilities: MHD stability; MHD instabilities: Kink and sausage instabilities, Rayleigh-Taylor instability for plasma and fluids; Plasma Applications: Plasma Sources, Sheaths and Applications.

Prerequisites

None

Teaching form

Lectures (6 CFU)

During the Covid-19 emergency period, the lessons will take place remotely, asynchronously and synchronously, with some events in physical presence.

The synchronous and asynchronous lessons will all be recorded and accessible at the times defined in the academic calendar 20-21.

The calendar of face-to-face events will be announced in October 2020 and events will take place after the first half of October 2020.

Textbook and teaching resource

Reference books:

R .J. Goldston, Introduction to Plasma Physics

M. A. Liebermann, Principles of plasma discharges and material processing, Wiley Interscience

Semester

First semester

Assessment method

Oral examination

Mark range: 18–30/30

Questions on the topic in the program

Office hours

THURSDAY from 11,30 to 13,30 on appointment p/o

Ed. U2 - Dipartimento di Fisica, Piazza della Scienza 3 - 3 floor, room 3014.

Phone: 0264482314
