DEGLI STUDI DI MILANO-BICOCCA

SYLLABUS DEL CORSO

Esperimentazioni di Fisica dei Solidi

2122-3-E3001Q064

Aims

The aim of the course is to present some characterization techniques for solid state physics. Particular attention is paid to semiconductors.

Contents

The course is composed by laboratory experiences addressed to the electrical and optical characterization of semiconductor (conductivity and Hall effect, p-n junction characterization, absorption and photovoltaic conversion of the light).

Frontal lessons will precede the laboratory activity.

Detailed program

The part of theoretical introduction concerns the following topics:

- DEFINITION
- CRYSTALLINE STRUCTURE
- BAND STRUCTURE
- INTRINSIC AND EXTRINSIC CARRIERS
- TRANSPORT
- HALL EFFECT
- JUNCTION p-n
- OPTICAL ABSORPTION
- PHOTOVOLTAIC CELL

During the laboratory different experiences are carried out regarding some properties of semiconductors or devices, measuring some fundamental quantities such as resistivity, mobility, life time, absorption or conversion efficiency of solar cells. An experience concerns the deposition of thin films.

Prerequisites

Physics courses and physics laboratories of the previous years.

Teaching form

Lessons will be in presence.

.....some introductory lectures on the main topics of solid state physics are introduced in order to allow a complete understanding of the experiences carried out in the laboratory

Students are divided into groups of 4-5 students. Groups are generally 5 or 6 in such a way that they can rotate all 6 already prepared experiences. If necessary, 1-2 new experiences can be added.

The currently active experiences are:

Hall effect in semiconductors

Solar power response in power

Spectral response to solar cells

Determination of life time in silicon

Transmittance measurements and semiconductor reflectance

Fotoluminescence

Textbook and teaching resource

Photocopies of the theoretical description and performance of the experiences provided by the teacher

Books suggested:

C. Kittel:

“Introduzione alla Fisica dello Stato Solido”

Bollati Boringhieri

Mario Guzzi:

“Principi di fisica dei semiconduttori”

Editore Ulrico Hoepli (Milano, 2004)

Semester

Second semester

Assessment method

At the end of the experiences, students must deliver a written report on one of the experiences chosen by the student. It is requested that the report is not particularly extensive (max 6 pages per experience). The paper must contain a brief description of the topic of the experience, the instrumentation used and the data collection procedure, an analysis of the data and finally a brief comment on the results.

In the oral exam the reports delivered and questions on the results obtained in the other experiences are discussed. Students are required to present themselves to the test with the laboratory notebook where the results of all the experiences are reported.

Office hours

On Tuesday at 2 pm by appointment
