SYLLABUS DEL CORSO

Ecologia Generale

2122-2-E3201Q076-E3201Q084M

Aims

The course provides basic knowledge of general ecology. The main objective of the course is the knowledge of the structure and functionality of the ecosystems, where the different species interact with each other and with the surrounding environment.

Particularly the following educational objectives are planned

Knowledge and understanding

Knowledge of the relationships between organisms and environment; quantitative analysis of ecological systems.

Knowledge and applied understanding

Knowledge, understanding, and application of the main methodologies useful for studying the ecosystems.

Autonomy of judgment

Through the acquisition of the concepts of ecology, the student will increase his ability in the comprehension of ecosystem functions

Communication skills

During the lessons, the student will be invited to take an active part in the lesson by discussing the topics covered in class. This will improve communication skills in public.

Ability to learn

The course will improve the student's learning skills in the interpretation of natural phenomena, and ecosystems functions

Contents**Contents:**

General Ecology: Energy fluxes and material cycling in the ecosystems. Primary and secondary productivity. Trophic chains. The biogeochemical cycles. Population responses as a function of environmental factors. Exponential and logistic growth of populations. Reproductive strategies. Interactions among populations in the biological communities. The concept of ecological niche. Biodiversity

Detailed program**General ecology:**

The multidisciplinary nature of Ecology and the study of the relationships between organisms and environment.

The physical environment: climate, aquatic and terrestrial environment.

The organisms and the environment: ecological genetics, adaptations and natural selection.

Populations: properties and growth of populations; metapopulations.

Populations: life history.

Intraspecific population regulation.

Metapopulation

Species interactions, population dynamics and natural selection.

Interspecific competition, parasitism and mutualism.

Community ecology

Community ecology (structure and dynamics of community, factors influencing the communities)

Ecosystem ecology (ecosystem energetics, decomposition and biogeochemical cycles).

The role of biodiversity in ecosystems. Factors of changes in biodiversity.

Terrestrial ecosystems. Ecoregions. Biomes.

Inland water ecosystems. The seasonal cycle in lakes. The functioning of rivers and the “river continuum” concept.

Marine ecosystems, biotic and abiotic conditions. Coral reef and Kelp prairies. The Mediterranean Sea.

Prerequisites

Basic knowledge of mathematics, chemistry, physics and statistics, as well as of botanical and zoological subjects.

Teaching form

- Lectures

Textbook and teaching resource

Assessment method

Oral examination at the end of the course. No partial tests during the course period are planned. The evaluation criteria during the exam will consist in the verification of the acquisition of competences by the student of the topics treated by the teacher during the lectures (related to the program of general ecology and applied ecology). The questions will aim to ascertain the acquisition of basic notions and to evaluate the understanding of the ecological concepts, the ability to link the different topics covered.
