SYLLABUS DEL CORSO

Calcolo delle Probabilità

2122-3-E3501Q014

Aims

To provide the basic concepts and tools of probability theory, enriched with a selection of models and applications.

At the end of the course, students will have acquired the following:

- *knowledge*: language, definitions and fundamental results in probability theory;
- *competence*: operational understanding of the main proof techniques;
- *skills*: ability to apply theoretical notions to the solution of exercises and the analysis of problems.

Contents

The first part of the course presents the mathematical modelling of random phenomena by means of **probability spaces**, following N. Kolmogorov's axioms based on measure theory. A great deal of attention is given to **random variabels**, which form the "operational language" of probability theory.

The second part of the course starts discussing the various notions of **convergence of random variables**. The fundamental **limit theorems** in the theory of probability are prsented, namely the *law of large numbers* and the *central limit theorem*. The course is concluded with an introduction to **Markov chains**, one of the simplest yet most important classes of stochastic processes.

Along the whole course, the presentation of the theory is enriched by the discussion of several **models and applications**.

Detailed program

1. *Probability spaces*

- Introduction to probability

- Axioms of probability
- Basic properties of probability
- ___
- Conditional probability
- Independence of events

2. *Random variables*

- Reminders of measure theory
- Important distributions, discrete and absolutely continuous
- Random variables
- Marginal laws and joint law

- Independence of random variables
- Transformations of random variables
- Expected value, moments, variance and covariance
- L^p spaces and inequalities
- Correlation and linear regression (hints)

3. *Convergence and limit theorems*

- Reminder on convergence theorems
- Borel-Cantelli lemma
- Weak and strong law of large numbers
- Notions of convergence for random variables
- Weak convergence of probabilities
- Law of small numers
- Central limit theorem and normal approximation
- Kolmogorov's 0-1 law

4. *Markov chains*

- Introduction to stochastic processes
- Markov chains and basic properties

- Recurrent and transient states
- Invariant and reversible measures
- Convergence theorem (hints)
- Absorption probabilities (hints)
- Random walks on graphs (hints)

5. *Models and Applications (presented alongside the theory)*

- Classical paradoxes (birthdays, Monty-Hall, Borel, Bertrand)

- Random permutation and fixed points
- Concentration of volume in high dimensions
- Weierstrass' approximation theorem
- Simulation of random variables
- Simple random walk
- Gambler's ruin

- The PageRank algorithm

Prerequisites

The knowledge, competences and skills taught in the courses of the first two years, in particular *Linear Algebra, Analysis 1 and 2 (= calculus in one and more variables), Measure Theory*.

Teaching form

The course is composed by lectures and recitations in the classroom:

- theoretical lectures (10 ects) are focused on the knoledge of definitions, results and relevant examples, as well as the competences linked to their comprehension;
- recitations (2 ects) are focused on the skills necessary to apply the theoretical knoledge and competencies to the solution of exercises.

The course is given in Italian.

Textbook and teaching resource

Reference textbooks

- F. Caravenna, P. Dai Pra. *Probabilità. Un'introduzione attraverso modelli e applicazioni.* Seconda Edizione (2021), Springer-Verlag Italia.
- D. F. Anderson, T. Seppäläinen, B. Valkó. *Introduction to Probability*. Cambridge University Press (2018).

- J. Jacod, P. Protter. *Probability Essentials*. 2nd Edition, Springer (2003).

Other dydactical material (available on the e-learning page of the course)

- Notes by the teacher on specific arguments
- Weekly exercise sheets (with detailed solutions)
- Written exams from previous years (with detailed solutions)
- List of proofs for the oral examination
- Lecture notes

Semester

Third year, First (Fall) Semester.

Assessment method

Written examination (or midterms) and oral examination, with the rules described in the sequel. The aspects that will be evaluated are the correctness of the answers, the creativity, the precision, the clarity of exposition.

There will be 5 exam sessions (two in February, one in June, one in July, one in September).

- The *written examination* lasts 3 hours and gets a mark out of 30. This examination tests both theotetical knoledge and competencies (definitions, examples and counter-examples) and practical skills (solving exercises). The written examination is passed with a minimal mark of 15/30 and allows to be admitted to the oral examination.
- In the middle and at the end of the course there will be two *midterm exams,* structured in analogy with the written examination, which last 1.5 hours each and get a mark out of 15. Passing both midterms with a minimal mark of 7,5/15 is equivalent to passing the written examination (with the "sum" of the marks) and allows to be admitted to the oral examination.

- The *oral examination* lasts 30-45 minutes and gets a mark out of 30. It can be given in any exam session of the academic year (after passing the written examination). The oral examination tests the knowledge of a selection of proofs as well as a working knowledge of the notions of the course. The oral examinations is passed with a minimal mark of 15/30.
- The final mark results from the average between the marks of the written and oral examinations. The exam is passed with a minimal mark of 18/30.

Exemption from the oral examination. Passing the written examination with a mark in the range 20-27/30 allows to be_____

Office hours

Upon appointment.
