# SYLLABUS DEL CORSO

# Anatomia e Cinesiologia

**2122-1-I0201D129**

## Aims

After the module the student will be able to accurately describe the movement of the joints of the human body segments using the appropriate vocabulary. The course aims at developing the students' knowledge of structure and function of the human body and its systems, with particular attention to the morphofunctional aspects of the musculoskeletal system, to develop the student's knowledge of the morphology of the bones, muscles and joints of the human body, their mutual relations and their function, biomechanics and kinesiology of the joint. The student will be able to make appropriate use of terms that identify the reference planes and the parameters that describe the movement kinesiology.

The module aims to allow the knowledge and learning of the basic elements of physics and biomechanics as a function of the ability to understand and analyze the movement of the human body, integrating the knowledge of anatomy and physiology of the nervous system and the knowledge of anatomy and physiology of the osteo-myo-articular system. Analyze the anatomy and function of the spine and limbs. Describe normal standing and sitting posture and locomotion. Advanced knowledge of the physiology of the osteo-myo-articular system (muscle contraction, analysis of physiological characteristics).

## Contents

The topics of the course include the notions of anatomy, kinesiology and biomechanics of the axial and appendicular skeletal joints. Particular attention will be paid to the action of the individual muscles or muscle groups responsible for the different modes of movement for each individual joint, whose degrees of freedom, joint widths, factors limiting movements and position of function will be assessed. The main muscle functions will be specified so that the different movements can take place and those that oppose them (antagonist muscles), contribute to movement (synergistic muscles) or limit the action of a component of the agonist muscle (neutralizing muscles). Each single module is described in its own reference syllabus

## Detailed program

The detailed program is described within each individual module.

## Prerequisites

## Teaching form

Lessons in attendance, subject to any ministerial changes following the COVID pandemic situation

## Textbook and teaching resource

Slides presented during the lessons

## Semester

First semester

## Assessment method

Closed-ended questions. True False; Multiple choice with one or more correct alternatives; Match (fill in the blanks). Open-ended questions. Oral at the discretion of the Professors

## Office hours

By appointment
