SYLLABUS DEL CORSO

Approccio Riabilitativo Al Paziente con Ictus Cerebrale, Grasp and Reach Training

2122-2-I0201D078

Aims

Develop neurophysiological and biomechanical knowledge to identify intervention priorities for early rehabilitation of the entire upper limb.

Experiment with manual skills to facilitate muscle activations necessary for the execution of the main phases of orientation of the upper limb to grip the object.

Contents

Theoretical and practical course on the knowledge of the physiological prerequisites of manual grasping and its possible post-ictal compromise and to experiment with possible physiotherapeutic proposals identified by the clinical practice of the Bobath approach.

Detailed program

Introduction

Upper limb in the motor scheme

Scapular stability and postural setting

Biomechanics of reaching

practical exercise aimed at facilitating for

Reduce the tension of the flexors

Mobilize bone structures

Introduce a selective pronation from supination

Strengthen the intrinsic muscles to support bone structures

Start exploring the digitization process

Prerequisites

Upper limb kinesiology, clinical evaluation of hand skills

Teaching form

introductory lesson followed by presentation of types of treatment and exercise on some simulated maneuvers in small groups.

During the emergency period for COVID-19, teaching could be provided through a synchronous remote connection. after having read the didactic material

Textbook and teaching resource

Semester

second semester late

Assessment method

Mandatory attendance.

Training supervision of tutors - teachers during practical experiences.

Office hours
