DEGLI STUDI DI MILANO-BICOCCA

## COURSE SYLLABUS

### Basic Calculus

2122-1-E3101Q100

---

#### Aims

In line with the educational objectives of the Degree in Computer Science, the course aims at providing the *knowledge* about the fundamental concepts and statements about limits, and differential and integral calculus for functions of one variable, together with some elementary basic logic. It will also build the *skills* needed to understand and use the most important arguments and techniques in the theory and the *ability* to solve exercises and deal with problems exploiting them.

#### Contents

Real numbers. Sequences and infinite series. Differential and integral calculus in one variable.

#### Detailed program

##### Real numbers

Elementary functions

Generalities on functions

Real variable functions

##### Sequences

Limits of real sequences

Induction principle

### **Limits and continuity**

Limits of functions

Continuous functions

Global properties of continuous functions

### **Differential calculus**

Derivatives of a function

Properties of differentiable functions

Convex and concave functions

Taylor's formula

Graphs of functions

### **Integral calculus**

Riemann integrable functions

Fundamental theorem of calculus and antiderivatives

Integration methods

### **Series**

Series, convergence, absolute convergence

Series with positive terms

Series with terms of non constant signs

### **Prerequisites**

Elementary algebra: symbolic algebra, equations and inequations of first and second degree; elementary trigonometry; logarithm and exponential.

### **Teaching form**

Lectures on the blackboard. The course is taught in Italian.

## Textbook and teaching resource

A. Albanese, A. Leaci, D. Pallara, [Appunti del corso di Analisi Matematica I](#)

## Semester

First semester

## Assessment method

**Examination type: written examination (oral examination optional)**

**Written part:** maximum mark 30/30. The written part is divided in two:

**first part:** 8 multiple choice questions (simple theoretical and practical exercises). Each answer: 1.5 points, if correct, -0.5 points, if wrong, 0 points, if not given.

**second part:** exercises, together with a theoretical question (the student is asked to provide, for instance, definitions, statements of theorems, examples).

**If the total score of the first part is less than 7, the second part is not corrected and the student must repeat the written part of the exam.**

The final mark of the written part is obtained by adding the mark of the first and the second part.

If the mark of the written part is more than, or equal to 18, the student can conclude the exam with the mark of the written part, without undergoing an oral exam, or, else, undergo an oral examination.

There will be a written test '[in itinere](#)' restricted to first year students.

**Oral part:** If the mark of the written part is more than, or equal to 18, the student may as well decide to undergo the oral exam (this choice must be communicated in due time).

**The final mark can be greater, equal or lower than the mark of the written part.**

## Office hours

By appointment.
