COURSE SYLLABUS

Advanced Gis Analysis

2122-2-F7401Q032

Aims

To improve the analysis and the modelling of spatial data with advanced techniques in GIS environment.

Contents

Theoretical and practical analysis and modelling of spatial data with advanced techniques related to: geomorphology, marine geology, engineering geology, structural geology.

Detailed program

Geomorphometry: DEM generation techniques and methods for editing and correction of DEM, topographic functions (slope, aspect, curvature) and terrain classification, hydrological functions and automatic detections of drainage basins. Examples of application for geological problems.

Geostatistics: generation of experimental variogram, variogram modelling, simple kriging, ordinary kriging, co-kriging. Examples of application to geological problems.

Lab activity: application of commercial (e.g., ESRI ArcGIS) and open-source (e.g., SAGA-GIS, SGeMS) software for a practical implementation of techniques

Prerequisites

GIS Lab (Bachelor Degree L34) or similar basic course on GIS.

Teaching form

Lessons and laboratory activity with the practical use of GIS software (e.g., ARCGIS, SAGA-GIS).

Textbook and teaching resource

Hengl T. & Reuter H.I. (2009): Geomorphometry: concepts, software, applications. Elsevier, 1-765.

M. Kanevsky and M. Maignan, (2004) Analysis and modelling of spatial environmental data, EPFL Press, Lausanne,

+ Course notes and power-point slides provided by the teacher. Scientific papers.

Semester

Fall semester

Assessment method

Test for the evaluation of the theoretical part + GIS exercise in the laboratory + discussion on the exercise.

Office hours

From Monday to Friday, 2 p.m. - 4 p.m.
