DEGLI STUDI DI MILANO-BICOCCA

## SYLLABUS DEL CORSO

### Fisiologia Umana

2223-2-H4101D253

---

#### Aims

Human physiology is the science of the mechanical, physical and biochemical function of humans and serves as the foundation for modern medicine. As a discipline, it connects science, medicine and health and creates a framework for understanding how the human body adjusts to stress, physical activity and disease. It is essential for medical students to receive a broad exposure of the physiological concepts underlying the functions of the human body that will prepare them to be critical thinker and provide the necessary foundation for further studies in pharmacology, pathology, pathophysiology and clinical medicine and surgery. The curricular objectives are mainly focused on the normal function of the organism, integrating knowledge on many levels (cell physiology, organ systems and the body as a whole). However, the material is presented in a context that prepares students for their role as physicians. Therefore, when possible, clinical examples will be used to illustrate the basic physiological principles.

#### Contents

The course systematically presents the concepts underlying the functions of the human body. The mechanism leading to function imbalance cannot be appreciated without a deep understanding of the biophysical and physiological basics. Therefore, such mechanisms that provide functions at the cellular, tissue, organ and apparatus level and at the integrated level will be introduced. In particular, the course will address the physiology of excitable and non-excitable cells, the cardio-circulatory system, the respiratory system, the nervous system, motor functions and higher nervous functions.

## **Detailed program**

Please, refer to the specific module

## **Prerequisites**

Knowledge of the preparatory courses indicated in the guidelines of the degree course

## **Teaching form**

Lectures.

## **Textbook and teaching resource**

Please, refer to the specific module

## **Semester**

Second year, first and second semester

## **Assessment method**

The exam consists in an oral test. Open questions will be posed to the student in order to evaluate the general knowledge of the topics. Moreover, the student will be asked to answer to questions that require the analysis of a complex phenomenon, its rationalization and the application of specific physiology principles and to solve simple exercises. Finally, a clinical case may be presented which will require the analysis of the interconnections between different physiological variables in the light of the theoretical paradigms.

## **Office hours**

The professors receive by appointment upon agreement by e-mail

## **Sustainable Development Goals**

GOOD HEALTH AND WELL-BEING
