SYLLABUS DEL CORSO

Scienza delle Finanze

2223-1-A5810003

Learning objectives

Public Finance, or Public Economics according to the recently adopted terminology, concerns the economic analysis of the State: how the government does affect the level of income, consumption and investments, the functioning of the markets, the wellbeing of citizen, and so on. Starting from the description of market failures and their motivations, the theory of public finance motivates governments' intervention in the economic sphere in the presence of natural monopoly, externalities, public goods and asymmetric information. Specific attention is devoted to the various topics related to taxation, both national and international, and to the main categories of public expenditure, particularly in the sectors of health care, education and social security. The process of public decision making is also treated in details and the main rules employed in the political and electoral mechanism are critically discussed. A specific space is assigned the analysis of Fiscal Federalism. The modern views of public sector economics are also compared to the Classical view on the economic systems.

Contents

1. Classical theories of the State intervention in the economy
2. Market theory: demand and supply; consumer; firm; equilibrium theory; market structures.
3. Welfare economics: First and second theorem of welfare economics. Market failures: public goods, externalities, natural monopoly, asymmetric information. Regulation.
