## SYLLABUS DEL CORSO

### Molecular Electronics and Photonics

2223-1-F5302Q017

---

#### Aims

The course deals with the physical principles of the properties of molecular semiconductors. Molecular crystals and quantum mechanic origins of the intermolecular forces. Carbon-based policonjugated systems: anisotropy, low-dimensional properties. Polymeric semiconductors.

#### Contents

ELECTRONIC STATES OF POLICONJUGATED MOLECULES AND POLYMERS.

EXCITED STATES IN MOLECULAR CRYSTALS.

ELECTROLUMINESCENCE AND LED DEVICES.

ORGANIC PHOTOVOLTAIC CELLS.

MOLECULAR ELECTRONICS AND PHOTONICS.

#### Detailed program

ELECTRONIC STATES OF POLICONJUGATED MOLECULES AND POLYMERS: Free-electron model, Hueckel's model. Band structure of conjugated polymers. Mono-electronic approximation: Su-Shrieffer-Heeger hamiltonian. Electron-phonon interaction and Peierls' gap. Solitons, polarons, bipolarons. Electronic correlation: Hubbard's Hamiltonian.

**LINEAR OPTICAL PROPERTIES:** Absorption and emission of conjugated molecules. Einstein's coefficients and Strickler-Berg's formula. Singlets and triplets. Optical spectra calculation with the "tight binding" method. Calculation of transition matrix elements. Kasha's rule. Non radiative processes. Lifetimes. Photoluminescence quantum efficiency and its measurement.

**EXCITED STATES IN MOLECULAR CRYSTALS:** Excited states in molecular aggregates: excitons classification (Frenkel, charge-transfer, Wannier). Delocalization and binding-energy: comparison between organic and inorganic materials. Calculation of the exciton energy. Davydov splitting. Exciton generation mechanisms. Exciton mobility. Coherent and incoherent energy transfer. Foerster's and Dexter's energy transfer. Photonics antenna.

**ELECTROLUMINESCENCE AND LED DEVICES:** Architecture of a prototype device and energetic levels diagram. Injection and charge transport. Exciton generation and recombination. Microcavities.

**MOLECULAR ELECTRONICS AND PHOTONICS:** Physics and architecture of organic light emitting diodes (OLEDs). Light harvesting, charge separation and transport. Organic and polymeric semiconductor cells and their architecture, charge separation: donors and acceptors. Planar and "bulk" heterojunction. Efficiency. Dye-sensitized solar cells based photo-electrochemical cells (Graetzel). Solar light harvesting optimization: "upconversion" and "downconversion" processes. Organic semiconductor-based lasers. Principles and use of organic molecules in fluorescence imaging techniques and super-resolution imaging. Macro-molecules, biomolecules and supermolecules and their meaning in physics, chemistry and biology. Employment of molecules for photoreactions in biology.

## **Prerequisites**

This course requires a good knowledge of quantum physics (time-independent and time-dependent Schroedinger Equations, perturbation theory, Fermi golden rule), structure of matter (atoms, molecules and solids) and some basic knowledge of organic chemistry.

## **Teaching form**

Lectures

## **Textbook and teaching resource**

T. A. Skotheim, "Handbook of Conducting Polymers"

J. M. André et. al., "Quantum chemistry aided design of organic polymers"

M. Pope C. E. Swenberg, "Electronic processes in organic crystals"

Several review articles supplied by the lecturer

## **Semester**

2nd SEMESTER

### **Assessment method**

Oral test aimed to verify the capability of the students i) to model and discuss the properties of organic molecules and materials; ii) to analyze the optical and electrical processes occurring in this class of materials; iii) to describe the operation, peculiarities and limits of the electronic and photonic organic devices.

### **Office hours**

By appointment

### **Sustainable Development Goals**

INDUSTRY, INNOVATION AND INFRASTRUCTURE

---
