SYLLABUS DEL CORSO

Analisi Superiore

2223-1-F4001Q055

Aims

The aim of the course is to introduce the theory of distributions and Sobolev spaces.

The expected learning outcomes include:

- the knowledge and understanding of the fundamental definitions and statements, as well as of the basic strategies of proof of modern analysis; the knowledge and understanding of some crucial examples in which the theory manifests itself;
- the ability to recognize the role that concepts and techniques from modern analysis introduced in the lectures (such as convolution, distributions, Sobolev spaces) play in various areas of pure and applied mathematics (numerical analysis, mathematical physics, probability); the skill to apply such conceptual background to the construction of concrete examples and to the solution of exercises; the ability to communicate and explain in a clear and precise manner both the theoretical aspects of the course and their applications to specific situations, possibly to different contexts.

Contents

Basics on toppological vector spaces, in particular on spaces of test functions and distributions, fundamental properties of distributions with applications, Sobolev spaces, second order elliptic problems.

Detailed program

Chapter 1. **Topological vector spaces**
Topological vector spaces, Frechet spaces, duality, boundedness.

Chapter 2. **Distributions and operations with distributions**
Distributions, tempered distributions. The main operations with distributions: derivation, convolution, pull-back.

Chapter 3. **Applications**
Applications to fundamental solution of classical differential operators.

Chapter 4. **Sobolev spaces**
Motivations, definitions and properties. Properties of Sobolev spaces: W?,?(?) is a Banach space, approximation by smooth functions, product and composition of Sobolev spaces. Sobolev spaces in dimension 1: existence of a continuous representative and fundamental theorem of calculus for $W^{1,?}(a, b)$ functions. Morrey Theorem. Sobolev inequality (Sobolev-Gagliardo-Nirenberg Theorem). Sobolev embeddings. Extension operator and Extension Theorem for half-spaces and bounded regular domains. Global approximation by smooth functions. Sobolev embeddings for extension domains. Embeddings for higher order Sobolev spaces. Rellich-Kondrachov Theorem. Existence of the Trace Operator ???: $W^{1,?}(?) \subset L^{?}(??)$ with $1? p < +?$ and ? being a half-space or bounded regular domain. Fractional Sobolev spaces and Gagliardo Theorem (hints). Characterization of $W^{1,??}(?)$ by traces.

Chapter 5. **Second order elliptic problems**
Lax-Milgram Lemma. Second order elliptic problems: variational formulation, existence of solutions. Poincaré inequality. Dirichlet Principle. Elliptic problems with Neumann boundary conditions: variational formulation and some hints on H(div,?) spaces. Poincaré?-Wirtinger inequality. Existence of solutions for the Neumann problem under compatibility conditions

Prerequisites

Calculus in several variables, linear algebra, basics of Hilbert and L? spaces.

Teaching form

Lectures with blackboard. The teaching hours will be dedicated either to the illustration of main results in the theory, or to the solution of exercises (previously assigned) containing (possibly fine) applications of the theory.

Textbook and teaching resource

- Notes available on the e-learning page of the course.
- A. Bressan. *Lecture Notes on Functional Analysis*. American Mathematical Society, 2013.
- H. Brezis. *Functional analysis, Sobolev spaces and partial differential equations*. Springer Science & Business Media, 2010.
- L.C. Evans. *Partial differential equations*, American Mathematical Society.

Semester

I semester.

Assessment method

The exam consists of a written test, aimed at verifying the level of knowledge, the ability to apply it to the resolution of exercises, the student's independence in making judgements, as well as his/her communication skills. The test is divided into two parts: the first part contains theoretical questions (proofs of part of the results illustrated during the course), while the second part contains exercises, often similar to those solved during the class hours. The two parts will contribute equally to the determination of the final grade.

Office hours

Upon appointment.
