UNIVERSITÀ
DEGLI STUDI DI MILANO-BICOCCA

COURSE SYLLABUS

Foundations of Computer Science

2223-1-FDS01Q009

Aims

At the end of the course, the students will understand how to query a database, and how to infer the implicit structure of a database from its tables.

Moreover, the students will be able to write and debug some simple programs in Python, to manage and analyze datasets consisting of a few interconnected tables, such as those usually available at kaggle.com (CSV, TSV, JSON formats). This part will taught with the Jupyter Notebook.

Finally, the students will be able to query a relational database using SQL, both via a dedicated interface and from a Python program.

Knowledge and understanding

This course provides basic knowledge and understanding on:

- Data bases
- SQL
- Programming in Python
- Jupyter notebooks
- Managing tabular datasets with Pandas

Ability to apply knowledge and understanding

At the end of the course the students will be able to:

- Write SQL queries
- Write Python notebooks to manage datasets
- Write Python notebooks to analyze and clean datasets

Contents

Organizing raw datasets: file system, delimited files.

Introduction to data bases. Relational Data Model and SQL. Select ... From … Where.

Introduction to programming with Python. Explorative programmaing. Managing tabular data.

Introduction to testing and debugging.

Detailed program

1. Organizing raw datasets
2. files, directories, types of files
3. main command-line commands
4. delimiter-separated values
5. Introduction to data bases.
6. The Relational Data Model.
7. SQL: Select ... From … Where on a table.
8. Querying two or more tables.
9. Introduction to programming in Python.
10. Arrays, lists, dictionaries
11. Loops
12. Organization of a programma: functions
13. Modules and libraries
14. Explorative programming. Managing tabular data.
15. The Jupyter Notebook
16. Pandas
17. Introduction to testing and debugging.

Prerequisites

Basic knowlege of any programming language

Teaching form

Lectures and exercises with a PC.

Textbook and teaching resource

- Downey Think Python 2e: How To Think Like a Computer Scientist

- Downey Think Stats 2e
- Downey Elements of Data Science. This book is a bit too basic.
- VanderPlas, Python Data Science Handbook
- Elmasri, Navathe, Fundamentals of Database Systems

Semester

First

Assessment method

The exam consists of 2 parts: a written exam (with open questions) on the data bases topics, and a small group (max 3 people) project, with an oral discussion, on the Python topics.

The grading of the written exam is based on the correctness and the completeness of the answers. The written exam consists of writing 4 SQL queries, where each query corresponds to an open-ended question.

The grading of the project is based on the individual contribution that is displayed during the oral discussion and on the fitness of the project to perform the required analysis.

The final grade is 1/3 of the written exam and 2/3 of the project.

There are no in-progress exams. Beware that you must be registered via "segreterie online" to take the exam. If you are not registered, you will not allowed to take the exam. No exceptions will be made.

Office hours

Office hourse are online. You can book a meeting at https://www.unimib.it/gianluca-della-vedova
