## COURSE SYLLABUS

### **Geotechnical Modelling for Slope Stability and Underground Geostuctures**

2324-1-124R032

---

#### **Title**

**Geotechnical modelling for slope stability and underground geostuctures**

#### **Teacher(s)**

Riccardo Castellanza ; Giovanni Crosta

#### **Language**

English

#### **Short description**

This course provides a general overview of advanced numerical modelling (finite elements based) in geotechnical engineering, engineering geology and also other problems. A specific and detailed critical discussion on existing and new techniques for numerical analyses of unstable slopes and underground geostuctures will be provided. The course is subdivided into 5 parts:

- (1) Introduction to numerical modelling of geotechnical problems;
- (2) Definition of the global PDE (Partial Differential Equations) system to cope with complex geotechnical problems

including slopes and geostructures;

(3) 3D Finite Element Method (3D FEM) specific aspects, coupled problems: chemo-thermo-hydro-mechanical modelling;

(4) Explicative case studies;

(5) New trends in numerical modelling in geomechanics: MPM (Material Point Method) and PFEM (Particles Finite Element Methods); multiphase problems; CFD (Computational Fluid Dynamics)

Evaluation: YES

## **CFU / Hours**

2 CFU - 20 Hours (8h lecture - 12h laboratory training)

## **Teaching period**

II semester

## **Sustainable Development Goals**
