

UNIVERSITÀ
DEGLI STUDI DI MILANO-BICOCCA

COURSE SYLLABUS

General Physiology

2324-2-E1301Q074

Aims

1. Knowledge and comprehension. The course brings the students to understand the fundamental physiological mechanisms of the animal organism (especially mammalian and human physiology).
2. Applied knowledge and comprehension. These concepts are indispensable for further studies in Systems Physiology, Pathology and Pharmacology. Reference is made to these disciplines, during the course.
3. Making judgements. The student will learn to apply the fundamental physiological knowledge to the different pathophysiological contexts, beyond the specific topics of the course.
4. Communication skills. Being able to properly explain the basic physiological concepts.
5. Learning skills. The acquired physiological concepts and notions will enable the student to further pursue personal studies.

Contents

1. Fundamentals of biophysics and transport mechanisms.
2. Cell physiology and neurophysiology.
3. Muscle physiology.
4. Sensory mechanisms.
5. Sensorimotor integration in the central nervous system.

6. Introduction to the regulation of different organs by the autonomic nervous system; endocrine mechanisms.

Detailed program

1. Fundamentals of biophysics and cell physiology, diffusion and transmembrane transport (active and passive, osmotic fluxes, volume and pH control).
2. Mechanisms of excitability and chemical and electric communication intra- and intercellular. Action potential and synaptic function.
3. Function and regulation of the muscle tissue with special reference to the skeletal muscle. Introduction to cardiac physiology.
4. Mechanisms of transepithelial transport.
5. Sensory systems physiology (somatosensory, visual, olfactory, auditory and taste). Neuromuscular physiology: reflex arc, central synaptic integration, introduction to motor control.
6. Organization of the global nervous and endocrine control of organic functions (autonomic nervous system, hypothalamus and hypophysis).

Prerequisites

Propedeutic exams: Citology and Anatomy; Physics.

Moreover, a general understanding of cellular biochemistry is a prerequisite (fundamentals of protein structure; cellular metabolism; main mechanisms of regulation of the protein function).

Teaching form

Oral lessons (in italian).

Textbook and teaching resource

Randall et al. Animal Physiology. V edition, Freeman.

For consultation:

Kandel et al., Principles of Neural Science, VI edition, 2021 McGraw-Hill (or previous editions).
Guyton & Hall Textbook of Medical Physiology, XIV edition (or previous editions), Elsevier.
Swanson, Brain Architecture, II edition, 2012 Oxford University Press.

Further books and review articles will be mentioned during the course.

Slides and video recordings of all the lessons will be made available on E-learning.

Semester

Second semester

Assessment method

There are no in itinere tests.

The exam is oral. The student is interviewed about the course's topics.

The exam consists of 2-3 general questions aimed at verifying the student's comprehension of the basic physiological concepts and mechanisms. Generally, the first question regards cell physiology and biophysics (transport mechanisms; action potential; synaptic mechanisms, etc.). The exam then proceeds with topics more related to system aspects (e.g., sensory mechanisms; motor control; autonomic nervous system).

Statistics between June 2022 and May 2023: 120 passed the exam, 92 of whom were enrolled in the 2022 course.

Office hours

Appointment by E-mail (andrea.becchetti@unimib.it)
