DEGLI STUDI DI MILANO-BICOCCA

## SYLLABUS DEL CORSO

### Foundations of Computer Science

2324-1-FDS01Q009

---

#### Aims

At the end of the course, the students will understand how to query a database, and how to infer the implicit structure of a database from its tables.

Moreover, the students will be able to write and debug some simple programs in Python, to manage and analyze datasets consisting of a few interconnected tables, such as those usually available at kaggle.com (CSV, TSV, JSON formats). This part will be taught with the Jupyter Notebook.

Finally, the students will be able to query a relational database using SQL, both via a dedicated interface and from a Python program.

#### *Knowledge and understanding*

This course provides basic knowledge and understanding on:

- Data bases
- SQL
- Programming in Python
- Jupyter notebooks
- Managing tabular datasets with Pandas

#### *Ability to apply knowledge and understanding*

At the end of the course the students will be able to:

- Write SQL queries
- Write Python notebooks to manage datasets
- Write Python notebooks to analyze and clean datasets

## Contents

Organizing raw datasets: file system, delimited files.

Introduction to data bases. Relational Data Model and SQL. Select ... From ... Where.

Introduction to programming with Python. Explorative programming. Managing tabular data.

Introduction to testing and debugging.

## Detailed program

1. Organizing raw datasets
2. files, directories, types of files
3. main command-line commands
4. delimiter-separated values
5. Introduction to data bases.
6. The Relational Data Model.
7. SQL: Select ... From ... Where on a table.
8. Querying two or more tables.
9. Introduction to programming in Python.
10. Arrays, lists, dictionaries
11. Loops
12. Organization of a program: functions
13. Modules and libraries
14. Explorative programming. Managing tabular data.
15. The Jupyter Notebook
16. Pandas
17. Introduction to testing and debugging.

## Prerequisites

Basic knowledge of any programming language

## Teaching form

Lectures and exercises with a PC.

Lectures will be neither recorded nor streamed.

## Textbook and teaching resource

- Downey [Think Python 2e: How To Think Like a Computer Scientist](#)
- Downey [Think Stats 2e](#)
- Downey [Elements of Data Science](#). This book is a bit too basic.
- VanderPlas, [Python Data Science Handbook](#)
- Elmasri, Navathe, Fundamentals of Database Systems

## Semester

First

## Assessment method

The exam consists of 2 parts: a written exam (with open questions) on the data bases topics, and a small group (max 3 people) project, with an oral discussion, on the Python topics.

The grading of the written exam is based on the correctness and the completeness of the answers. The written exam consists of writing 4 SQL queries, where each query corresponds to an open-ended question.

The grading of the project is based on the individual contribution that is displayed during the oral discussion, including the ability to explain the choices made to complete the project, and on the fitness of the project to perform the required analysis. Both the written exam and the project discussion must be completed by September 2024.

The final grade is 1/4 of the written exam and 3/4 of the project.

There are no in-progress exams. Beware that you must be registered via "segreteria online" to take the exam. If you are not registered, you will not allowed to take the exam. No exceptions will be made.

## Office hours

Office hours are online. You can book a meeting at <https://www.unimib.it/gianluca-della-vedova>

## Sustainable Development Goals
