SYLLABUS DEL CORSO

Advanced Machine Learning

2324-2-F1801Q151

Aims

This machine learning advanced course is aimed especially for students who are already familiar with the basics of machine learning and wish to strengthen their knowledge and explore important advanced topics in order to posses in-depth and wide range capabilities at this so important field.

The course will cover some of the most important advanced topics in machine learning such deep learning and reinforcement learning, with their underlying theory but also a focus on modeling and practical implementation.

These advanced techniques will be applied to a number of applications, including: image recognition, natural language processing, recommendation systems.

Contents

Introduction to Deep Learning

Optimization techniques for training deep models

Convolutional Neural Networks

Unsupervised representation learning

Deep Learning for data sequences

Model Compression

Federated Learning

Detailed program

Training Deep Networks:

Objective functions

Activation Functions

Regularization

Gradient-based optimization

Focus on Deep Networks:

Autoencoders

Convolutional Neural Networks

Recurrent and Recursive Networks

Model Compression

Federated Learning

Practical Methodology:

Performance Metrics and baseline models

Selecting hyper-parameters

Prerequisites

Basic Machine Learning techniques

Teaching form

The course includes a part of theoretical lessons that will be held in the classroom and a part of exercises that will be held in the laboratory and / or classroom and which will require the use of your PC (or the one available at the University's computer labs).

The practical implementation of case studies will require the basic knowledge of R and Python programming languages.

The course will be in English.

Textbook and teaching resource

Ian Goodfellow and Yoshua Bengio and Aaron Courville, Deep Learning, MIT Press, 2016. http://www.deeplearningbook.org

Rasmussen, Gaussian Processes for Machine Learning, the MIT press 2006.

Francesco Archetti, Antonio Candelieri, Optimization and Data Science, SpringerBriefs, 2019

Further resource material will be made available on the e-learning platform.

Semester

First semester

Assessment method

There are two mutually exclusive exam modalities

1. Assignments [0-8 pt] + written test [0-10 pt] +Project/In Depth Study[0-15 pt]

- Along the course a number of assignments will be proposed to be resolved individually. Assignment **must be delivered on the established date**. No assignment will be considered after deadline.
- Two written tests, consisting closed questions or brief definitions, aimed at evaluating: Knowledge of Fundamental Concepts, Overall Understanding, Knowledge of specific models and methods about the course contents.
- A project/in depth study to be done in groups of 2/3 students. The project will be evaluated according to the following criteria:
- A structured report
- Oral presentation of the project/"In depth study" aimed also at evaluating argumentation ability

2. Written exam [0-15pt] + Project/In Depht Study [0-15pt]

- A written exam, consisting of both closed and open questions, aimed at evaluating: Knowledge of Fundamental Concepts, Overall Understanding, Knowledge of specific models and methods about the course contents.
-
- A project work/in depth study to be done in groups of 2/3 students. The project will be evaluated according to the following criteria:
- A structured report

- Oral presentation of the project/"In depth study" aimed also at evaluating argumentation ability
