UNIVERSITÀ
DEGLI STUDI DI MILANO-BICOCCA

SYLLABUS DEL CORSO

Computational Modelling

2324-1-F5105P022

Learning area

Research methods in experimental psychological sciences

Learning objectives

Knowledge and understanding

- Methodological and epistemological foundations in cognitive modelling
- Development of computational models: techniques and approaches
- Methods for the validation and assessment of the models

Applying knowledge and understanding

- Development of simple models in different domains of human cognition
- Application of toolkits to existing datasets
- Validation of computational models through behavioral data
- Critical analysis and interpretation of the model and its predictions

Contents

The course aims to provide an introduction to the use of computational modeling in cognitive sciences. The theoretical and epistemological bases of the approach will be described, as well as the main methods of developing and validating a model, with examples from different domains of human cognition. The lectures will be accompanied by hands-on practice with the techniques and methodologies introduced.

Detailed program

Introduction to computational modelling and Artificial Intelligence

Epistemological foundations of cognitive modeling

Levels of description and representation

Methods for developing models in different domains of cognition

Tuning, setting, and interpreting parameters

Training and validation of learning models

Simulation of behavioral data

Model evaluation: quantitative performance and theoretical criteria

Example: implementing an exemplar-based model for categorization

Example: implementing a model for the phonological loop

Example: training models based on the Rescorla-Wagner equations

Example: training and testing neural networks

Prerequisites

Familiarity with R. General knowledge in the field of cognitive psychology

Teaching methods

Lectures.

Discussions about the role of computational methods in psychology.

Hands-on experience with specific toolkits, implementation of simple models, and setup of simulations in the R environment.

Attendance is required.

Assessment methods

Individual assignments will require students to replicate the scripts developed in class, and to produce short essays concerning their views on cognitive modelling and AI.

Moreover, assignments will require the students to apply the practical knowledge acquired during the course. These will include modifying simple scripts, evaluating the impact of different parameters on model performances, testing model predictions against human-generated data, and comparing simulations from different models.
