DEGLI STUDI DI MILANO-BICOCCA

SYLLABUS DEL CORSO

Laboratorio di Metodi Quantitativi per la Psicologia dello Sviluppo - Turno B

2324-1-F5103P107-TB

Learning area

Area of experiential learning

Learning objectives

Knowledge and understanding
Know and understand what Analysis of Variance (ANOVA) and linear regression models are, have a basic knowledge of more advanced techniques such as generalized linear models
Identify when and why the above statistical techniques can be used to answer which theoretical questions

Ability to apply knowledge and understanding
Choose the appropriate ANOVA model for the data at hand and run it with the software
Choose and run the appropriate linear regression model for the data at hand
Be able to interpret the results and the inferences they allow
Understand which type of advanced statistical model applies to different data types

Contents

Using the statistical software JAMOVI, we will focus in particular on various ANOVA models and multiple linear regression models. During the laboratory meetings, students will learn to perform statistical analyzes on different data and interpret the results.

Detailed program

Brief introduction to JAMOVI
Analysis of Variance models (between-subjects, within-subjects, mixed design)
Regression analysis (simple and multiple – mediation and moderation)
Brief notes on generalized linear models

Prerequisites

Students should have a basic knowledge of software for creating and managing empirical data (e.g., Excel, SPSS, or similar), in order to be able to perform simple operations (data entry, variable creation,…). The main theoretical notions regarding the different statistical techniques used will be provided in the laboratory meetings.

Teaching methods

Presentation of the main notions of the statistical techniques addressed, examples of analysis, and individual performance by the students of similar exercises.

Assessment methods

Students are required to have a frequency of at least 70% of the course.

During the meetings, students will carry out specific exercises on the two main topics studied (Analysis of Variance and Multiple Linear Regression) to evaluate their skills in examining the validity of some hypotheses by performing appropriate analyses and adequately interpreting results.
