COURSE SYLLABUS

Alcoholism and Alcohol-Related Problems

2425-2-I0101D118

Aims

- To know the clinical, psychological/behavioural aspects, social relapses and services available for the treatment and support of patients suffering from alcoholism.

Contents

Epidemiological data on the phenomenon
Clinical and care aspects
The alcohol-related problems
Prevention and rehabilitation
Testimonies of persons involved

Detailed program

The course is divided into two sessions.

- Historical-epidemiological scenario.

Key epidemiological data from WHO and ISS Italian sources and scientific literature will be presented.

- Clinical and care aspects.

The main and fundamental definitions related to the problem of alcohol use and abuse will be introduced, based on ICD-11 and DSM-5 classifications and other essential definitions. Then, will be treated in a synthetic way the main pathological conditions caused by alcohol and its abuse, organic pathologies in the various body and psychiatric districts. The discussion will pay particular attention to the conditions that have the greatest impact on the nursing profession. Ample space will in fact be dedicated to pathologies of frequent and not easy management in the emergency room and in hospital departments, such as acute alcohol poisoning and alcohol withdrawal syndrome.

Students will be provided with the theoretical basis to address these issues, based on the role and duties of the nurse.

- **Psychological and behavioural aspects**

The course will devote ample space to the psychological aspects of alcoholism. The path that can lead to complete rehabilitation from alcoholism will be explained in detail and in its necessary graduality. Mention will be made of the main methods of clinical psychology used and approved by the scientific community for the treatment and rehabilitation of alcoholism. Finally, the theoretical basis of the method of rehabilitation of alcoholics, known as the 12 steps, will be illustrated. The course, especially in this session, aims to convey the correct psychological professional attitude towards the alcoholic patient, which clearly excludes the judgmental one, not unlike how it should be the one adopted towards the sick and suffering from other forms of dependence and diseases.

- **Social aspects**

A part of the course will be dedicated to illustrate the method of work applied in Ser-D towards the alcoholic user, whether it is addressed in person or for the interest of family members, whether it is sent by an institutional authority following traumatic events, accidents or to violation of laws and regulations (in particular of the highway code). The topic of activity in Ser-D will be treated from the point of view of the social worker and the purely nursing. Particular emphasis will be placed on the importance of team work within the Ser-D and network aimed at the territory: hospital first aid, hospital wards, hospital doctors and general practitioners, community homes, rehabilitation facilities. In each of these facilities or levels of care, the nurse has a key role in managing alcoholism and alcohol-related problems. This role will be outlined during the course.

- **Experiences and testimonies of people and family**

The direct testimonies of people who have had to deal with the problem of alcoholism, in the first person or indirectly, being familiar with the subjects who have been affected, are of fundamental importance for the understanding of the problem and are integrated with the theoretical notions provided in the lessons.

- **Debate**

Prerequisites

Enrolling in the 2nd-3rd year of the Bachelor's Degree in Nursing

Teaching form

Face-to-face teaching - Frontal lecture and testimonials
