SYLLABUS DEL CORSO

Statistica per il Turismo: Modelli e Applicazioni

2425-1-F7601M051

Learning objectives

By the end of this course, students will be able to apply statistical methods to analyze and predict tourism phenomena and evaluate the efficacy of intervention policies.
In particular, students can:

- describe and identify adequate methods to analyze a specific tourism phenomenon and motivate the method chosen
- perform statistical analysis using the software R: descriptive analysis, parameter estimation, interpretation, and critically assessment of the results obtained
- explain the methods and communicate the results to an audience that might not be familiar with statistical methods

Contents

The course aims to introduce statistical methods to analyze and predict tourism phenomena and evaluate the efficacy of intervention policies.
After recalling basic statistical concepts, we introduce the models to explain the tourism demand and evaluate the efficacy of intervention policies. We then consider the statistical models to predict tourism flows. We illustrate the methods using examples and practical part using the software R.

Detailed program

Basic statistical concepts:

- Measure of centrality
- Measure of variability
- Relationships between two variables (regression and contingency)
- Probability and random variables
- Statistical inference (estimate and hypothesis testing)

Linear regression model

- aim, definition and assumptions
- estimate
- parameter interpretation

Introduction to time series:

- definition and basic concepts
- graphical representation
- descriptive analysis

Linear operators:

- periodic and non-periodic lag operator
- periodic and non-periodic difference operator
- application of difference operators to remove trends from time series

Dynamic analysis of tourism demand:

- autoregressive (AR), moving average (MA) and non-seasonal, and seasonal mixed (ARMA) models
- non-seasonal and seasonal ARIMA models;

Predict tourism flows based on:

- deterministic and stochastic univariate models
- simple and multiple regression models

Prerequisites

None

Teaching methods

Face-to-face lectures (38 hours) and practicals (18 hours). If computer labs are unavailable due to building renovation, the first practicals (nearly 6 hours) will be face-to-face, and the others (nearly 12 hours) will be in synchronous remote delivery mode

Assessment methods

A written exam consisting of theoretical questions, exercises, and the interpretation of the results jointly with a report concerning the analysis of tourism data using the software R. The written exam assesses the knowledge of the methods introduced, the student's ability to choose the adequate statistical method given a specific research question, and the ability to interpret results. The report assesses the ability to implement the analysis in R. The report is compulsory and adds up to three points to the written exam grade if the grade is at least 18
