

UNIVERSITÀ DEGLI STUDI DI MILANO-BICOCCA

SYLLABUS DEL CORSO

Laboratorio: Interventi Psicologici a Bassa Intensità in Ambito Evolutivo

2425-2-F5107P028

Learning area

Models and techniques for intervention and rehabilitation

Learning objectives

Knowledge and understanding

- Develop an understanding of assessment methods aimed at evidence-based intervention planning.
- Develop an understanding of low-intensity psychological and psychoeducational intervention models, knowing how to identify commonalities and differences from other intervention models.
- Increase knowledge and understanding of models of applying family-centered care that is sensitive to cultural differences.

Applying knowledge and understanding

- Develop the ability to apply knowledge with respect to issues of acceptability and feasibility of intensive evidence-based models in public health settings.
- Develop the ability to apply knowledge and understanding of the content and intervention methods of the Thinking Healthy models; Problem Management Plus and Caregiver Skills Training
- Begin to develop the ability to apply knowledge and understanding of techniques and skills to be used for effective interaction with families and other professional colleagues

Contents

The workshop aims to provide the theoretical foundations, methodological principles, and an introduction to the techniques of low-intensity psychological and psychoeducational intervention models. Theoretical and applied material will be presented on the main topics concerning the planning and delivery of psychological and psychoeducational interventions, with reference to issues and problems related to the implementation of evidence-based intervention models in public health settings, from a global perspective and then specifically with reference to the Italian National Health Service.

Detailed program

Three psychological intervention models promoted by the WHO and allied to the just published WHO Mental Health Report (2022) will be presented: a model for supporting perinatal depression (Thinking Healthy1); a model of support for adults in psychological distress under conditions of adversity (Problem Management plus2, PM+); and a model of support for caregivers of individuals with neurodevelopmental disorder (Caregiver Skills Training3, CST). For each model specifically, the main characterizing elements will be discussed in detail, including: the underlying theoretical model; intervention strategies; and delivery characteristics (setting; provider; intensity and duration). Content and application tools of the models will be presented from a skills development perspective for the role of the psychologist in public health services with particular reference to primary care.

Prerequisites

- Knowledge of elements of Clinical Psychology.
- Knowledge of elements of Organization and development of psychological services and care pathways.

Teaching methods

Teaching methods include interactive teaching with observation of videorecorded material, role play and case discussion.

Assessment methods

The 70% of participation is necessary for approval.

Textbooks and Reading Materials

Details about the reading materials will be provided to students on the related e-learning page.
