COURSE SYLLABUS

General Ecology

2425-2-E3201Q076-E3201Q084M

Aims

The course provides basic knowledge of general ecology. The main objective of the course is the knowledge of the structure and functionality of the ecosystems, where the different species interact with each other and with the surrounding environment.

Particularly the following educational objectives are planned

**Knowledge and understanding
Knowledge of the relationships between organisms and environment; quantitative analysis of ecological systems.

**Knowledge and applied understanding
Knowledge, understanding, and application of the main methodologies useful for studying the ecosystems.

Autonomy of judgment
Through the acquisition of the concepts of ecology, the student will increase his abiltià in the comprehension of ecosystem functions

**Communication skills
During the lessons, the student will be invited to take an active part in the lesson by discussing the topics covered in class. This will improve communication skills in public.

**Ability to learn
The course will improve the student's learning skills in the interpretation of natural phenomena, and ecosystems functions

Contents

Contents:

General Ecology: Energy fluxes and material cycling in the ecosystems. Primary and secondary productivity. Trophic chains. The biogeochemical cycles. Population responses as a function of environmental factors. Exponential and logistic growth of populations. Reproductive strategies. Interactions among populations in the biological communities. The concept of ecological niche. Biodiversity

Detailed program

General ecology:

The multidisciplinary nature of Ecology and the study of the relationships between organisms and environment.

The physical environment: climate, aquatic and terrestrial environment.

The organisms and the environment: ecological genetics, adaptations and natural selection.

Populations: properties and growth of populations; metapopulations.

Populations: life history.

Intraspecific population regulation.

Metapopulation

Species interactions, population dynamics and natural selection.

Interspecific competition, parasitism and mutualism.

Community ecology

Community ecology (structure and dynamics of community, factors influencing the communities)

Ecosystem ecology (ecosystem energetics, decomposition and biogeochemical cycles).

The role of biodiversity in ecosystems. Factors of changes in biodiversity.

Terrestrial ecosystems. Ecoregions. Biomes.

Inland water ecosystems. The seasonal cycle in lakes. The functioning of rivers and the “river continuum” concept.

Marine ecosystems, biotic and abiotic conditions. Coral reef and Kelp prairies. The Mediterranean Sea.

Prerequisites

Basic knowledge of mathematics, chemistry, physics and statistics, as well as of botanical and zoological subjects.

Teaching form

24 lectures (two hours each), in person, Delivered Didactics

Textbook and teaching resource

Smith and Smith – *Elementi di Ecologia* - Pearson Editore

Assessment method

Oral examination

Oral examination at the end of the course. The evaluation criteria will consist in the verification of the student's knowledge of the program presented during the course of general and applied ecology, as well as on the experiences made during the attendance of the laboratory of ecology (the presence is compulsory for at least 75% of the lectures). The exam will aim to ascertain the acquisition of basic skills and to evaluate the understanding of the concepts, the ability to connect the various topics covered. It is underlined that, at the end of the laboratory activities, an oral exam with a vote expressed out of thirty is foreseen. Consequently, the final vote will be calculated using the weighted average of the credits of the three parts of the course (General Ecology, Applied Ecology and Applied Ecology Laboratory).

mark range 18-30/30
