

## COURSE SYLLABUS

### Geopedology

2425-3-E3201Q079

---

#### Aims

- Know the soil and its main characteristics; understand factors and processes of soil formation.
- Be able to perform a simplified description of the soil in the field and accomplish some of the main analytical determinations in the laboratory.
- Understand the basic mechanisms of the most common pedological taxonomies and be able to perform the simplified classification of a soil profile.

#### Contents

- Soil as an environmental and productive resource; ecosystem services provided by the soil
- Soil description.
- Main physical and chemical soil parameters.
- Factors of soil formation.
- Pedogenetic processes.
- Main soil taxonomic classification systems.
- Soil laboratory analysis.
- Soil-landscape relationships.

#### Detailed program

##### Lessons

- Definition of soil; its environmental, agricultural and forestry importance; ecosystem services carried out by soils.

- The soil profile and the horizons; morphological description of the soil and denomination of genetic horizons.
- Main physical (thickness, rock fragments, texture, density) and chemical (pH, organic carbon, carbonates, exchange complex, fertility elements) soil parameters.
- Factors of soil formation: climate and pedoclimate, living organisms (vegetation, pedofauna, anthropic action), terrestrial relief and geomorphology, parental material and lithology, time and length of processes.
- Pedogenetic processes: addition, subtraction, mixing, transfer, transformation. Main processes: brunification, leaching, calcification, salinization, podzolization, vertisolization, gleying. Characteristics of the most widespread soil taxonomic classification systems: World Reference Base for Soil Resources (FAO) and Soil Taxonomy (USDA). Diagnostic horizons and methods of classification of a soil profile.

#### Laboratory

- Main laboratory determinations: sample preparation, pH, texture, carbonates, organic carbon, organic matter, cation exchange capacity, exchangeable cations, available phosphorus, aggregate stability, infiltration rate.

#### Field activities

- Two excursions for the description of natural soils and the study of soil-landscape relationships: the soils of the plain and of the recent morainic.

### Prerequisites

- Prerequisites: basic knowledge of inorganic chemistry, lithology and mineralogy, geomorphology; this knowledge will be considered already acquired.

### Teaching form

- 16 two-hour lectures, in person, Delivered Didactics
- 1 four-hour lab activity, in person, Interactive Teaching
- 2 three-hour lab activities, in person, Interactive Teaching
- 2 five-hour field activities, in person, Interactive Teaching

### Textbook and teaching resource

Educational material distributed:

- Slides projected during the lessons: made available on the e-learning website.
- Laboratory analysis methods: made available on the e-learning website.
- Material for field activities: made available on the e-learning website.

## **Semester**

First semester

## **Assessment method**

Written exam with optional oral exam.

The written exam includes open-ended questions (very short essays or analysis of problems) and closed answer questions (multiple choice answers), related to all the topics covered in the course (lectures, laboratories, field activities); the text is evaluated in thirtieths (20/30 in total for open-ended questions; 10/30 in total for closed answer questions). Upon request of the student or teacher, the written exam can be supplemented by an oral exam (related to all the topics covered in the course), carried out by means of verification questions. The outcome of the oral exam can lead to an increase or decrease of maximum 4 points of the grade of the written exam (therefore, it is possible to be admitted to the oral exam when the grade of the written exam is at least equal to 14/30). There are no intermediate tests.

## **Office hours**

On appointment
