DEGLI STUDI DI MILANO-BICOCCA

SYLLABUS DEL CORSO

Laboratorio per L'analisi delle Acque Superficiali e Sotterranee

2425-3-E3201Q114

Aims

The main objective of the course is to enable students to acquire both theoretical and practical skills regarding the (a) measurement and elaboration of physical and physico-chemical parameters and (b) sampling for chemical and biological analyzes of surface water and groundwater bodies, with the aim of identifying their interrelations.

At the end of the course, students will be able to carry out the main field operations for the monitoring of surface water and groundwater bodies, such as the (a) measurement of river discharge and hydrometric level and groundwater table level, (b) lab analysis of selected chemical and biological parameters and (c) elaboration with IT tools of the data acquired in the field.

At the end of the course the student will have acquired independent judgment on the characterization of surface water and groundwater bodies, establishing the type of interrelation between them.

Contents

Theoretical and practical aspects related to the monitoring and characterization of surface water and groundwater bodies.

Detailed program

The course is composed of frontal lessons, field trips, chemical/biological and IT lab sessions.

The frontal lessons will cover the following topics: natural and human-altered water cycle, characteristics of surface water and groundwater and their interconnections, interface areas between surface water and groundwater bodies,

water sampling techniques, main physical, physico-chemical and chemical parameters used for the analysis of water bodies, techniques for the elaboration of collected data.

The field trips will be aimed at (a) acquiring several data, such as geographical position and altitude, hydrometric levels of rivers, piezometric levels in piezometers, river and spring discharge, physico-chemical parameters, and (b) sampling surface water and groundwater for chemical and biological analyzes.

The chemical and biological lab will focus on the analysis of chemical compounds and biological communities that are fundamental to define the quality of water and useful for highlighting the interconnections between surface water and groundwater bodies. Adaptation to life of plant and animal organisms in flowing and static waters will be also studied.

The IT lab will focus on the (a) post-processing of the geographic positions and elevations acquired in the field, (b) creation of maps of the measured points, (c) processing of the data acquired in the field for the calculation of discharge values and loads of dissolved chemical substances, (d) processing of piezometric and hydrometric data acquired in the field, and of meteorological data downloadable from the web, (e) interpretation of the elaborations to determinate the relationships between surface water and groundwater bodies.

Prerequisites

Basic knowledge of chemistry, earth science and ecology.

Teaching form

The structure of the course is:

- 8 two-hour lectures, in person, Delivered Didactics;
- 3 five-hour field activities, in person, Interactive Teaching;
- 2 two-hour and 2 three-hour ecological lab activities, in person, Interactive Teaching;
- 3 two-hour and 3 three-hour IT lab activities (LIBaaS), in person, Interactive Teaching.

Textbook and teaching resource

Slides and other documents provided by the teachers through the e-learning webpage of the course.

Semester

II semester

Assessment method

Oral examination that includes the presentation of the elaboration and interpretation of the data measured in the field/laboratory and some questions aimed at verifying the degree of knowledge acquired and the ability to apply the interpretative tools acquired.

More specifically, it is required to make a short presentation related to an exam assignment to test problem solving and communication skills.

The oral interview will focus partly on the discussion of the exam assignment and partly on the discussion of topics covered in class, with the aim of assessing the ability to critically understand and analyze a problem.

There will be no in itinere examinations.

Office hours

By appointment
