## SYLLABUS DEL CORSO

### Marine Molecular Biology

2425-2-F7502Q019

---

#### Aims

This course introduces the basic aspects of the molecular and cellular biology of marine organisms. Topics include the methodology and applications of molecular biology as a means of examining ecosystem-wide biological processes. At completion of the course, the students should be able to define specific biological problems with corresponding molecular markers, to design compatible experimental procedures and to define the necessary analytical protocols.

#### Contents

Principles and applications of molecular biology tools (genomics, transcriptomics and proteomics) for the study of marine ecology.

#### Detailed program

##### Introduction

- Organization and structure of genomes.
- Principles of molecular evolution of genes.
- Relationship between gene regulation and biological functions.
- Phylogenetic relationships among marine organisms

##### Genomics

- Genome sequencing methods: dideoxy procedure, primer walking, pyrosequencing, use of reversible chain

terminators, sequencing by ligation, large-scale DNA sequencing methods: shot-gunning strategy for sequencing genomes, cyclic array

- sequencing whole genome of key organisms, genome comparison for phylogeny, genomic analysis of natural communities, genomic analysis of communities (genome ecology),
- Polymerase Chain Reaction (PCR): principles and application in marine ecology
- Species identification by barcoding.

### **Transcriptomic**

- Northern analysis
- Quantitative real-time polymerase chain reaction (QPCR): principles and probes;
- Absolute and quantitative analyses
- DNA arrays: cDNA and oligonucleotide arrays

### **Proteomic**

- Preparation of protein samples from bacteria, plants and animal tissues.
- SDS PAGE and protein detection by Western analysis.
- 2D gel electrophoresis: 2D protein patterns, mass spectrometry and comparative analyses.

### **Prerequisites**

Undergraduate Molecular Biology and Ecology

### **Teaching form**

21 two-hour lectures, in person, Delivered Didactics

### **Textbook and teaching resource**

The students can use "Gene Cloning and DNA Analysis: An Introduction" T.A. Brown 7th Edition as general textbook. The teaching material used for the lessons is available on the e-learning platform.

### **Semester**

The course will take place in the first semester according to a timetable that will be published.

### **Assessment method**

**Examination type:**

Oral examination. Students will perform a presentation focused on a research paper based on Molecular Biology approach and they will discuss about the principles and applications of technologies introduced in this course. During the exam the candidate must demonstrate his ability to address and critically discuss the topics. More in detail the examination consists of a PowerPoint presentation of a scientific article. Once you have chosen the article, please send it to the teacher for approval. The rules and suggestions for the presentation are uploaded on the e-learning of the course. The following aspects are evaluated: (a) graphical aspects, (b) insights into the article, and (c) clarity of the presentation.

**Mark range:** 18-30/30

## **Office hours**

The teacher will receive by appointment. Monday - Friday 9.00-17.00

## **Sustainable Development Goals**

LIFE BELOW WATER
