COURSE SYLLABUS

Laboratory of Solid State and Quantum Technologies I

2425-1-F1701Q145

Aims

Development of experimental skills related to solid state physics and quantum technologies using advanced laboratory techniques based mainly on optical spectroscopy and superconducting quantum devices.

Contents

Implementation of an experiment based on the application of quantum physics. The student will be able to investigate a specific area choosing between quantum materials and cryogenic devices for quantum computation and metrology.

Detailed program

The course consists of an experiment performed by students divided into groups of three or four people.

The lab activities will follow introductory lessons on the correlation between physical properties of the solids, quantization effects and the associated experimental techniques. Besides the design of the experiment, students will conduct the characterization of the system under examination, complementing the activities with data analysis and a written report.

Examples of experiences:

Solid State group:

- Quantum optics experiments using single photons and quantum key distribution;

- Optical spin orientation and effects of quantum confinament on optical transitions;
- Design and characterization of quantum dot emitters for applications in quantum information;
- Fabrication and characterization of photonic nanoantennas for quantum communication applications.

Cryogenic lab group:

- Characterization, control and readout of a superconducting qubit;
- Single photon detection by means of a cryogenic detector;
- Characterization of a parametric amplifier with quantum limited readout noise.

Prerequisites

Bachelor in physics or equivalent.

Teaching form

Teaching makes use of interactive teaching (laboratory). The practical sessions will be conducted in the laboratories located in the buildings U2 and U5.

Textbook and teaching resource

Semester

First semester

Assessment method

The assessment method consists of a project work written by the group and its discussion in a final oral exam (with a presentation) to evaluate the knowledge and the communication skills in the disciplinary field.

Tests will not be conducted in itinere.

The final mark is also based on the skill showed in the development of the lab experiment.

Office hours

A help desk will be provided to the students upon direct request via email to the instructor. All the information related to the contacts and office address can be found at the university website.

Sustainable Development Goals

INDUSTRY, INNOVATION AND INFRASTRUCTURE
