COURSE SYLLABUS

Management of Patients With Acute Stroke, Grasp and Reach Training

2526-2-I0201D078

Aims

Develop neurophysiological and biomechanical knowledge to identify intervention priorities for early rehabilitation of the entire upper limb.

Experiment with manual skills to facilitate muscle activations necessary for the execution of the main phases of orientation of the upper limb to grip the object.

Contents

Theoretical and practical course on the knowledge of the physiological prerequisites of manual grasping and its possible post-ictal compromise and to experiment with possible physiotherapeutic proposals identified by the clinical practice of the Bobath approach.

Detailed program

Introduction

Upper limb in the motor scheme

Scapular stability and postural setting

Biomechanics of reaching

practical exercise aimed at facilitating for

Reduce the tension of the flexors

Mobilize bone structures

Introduce a selective pronation from supination

Strengthen the intrinsic muscles to support bone structures

Start exploring the digitization process

Prerequisites

Upper limb kinesiology,

Teaching form

Frontal teaching 2h

interactive teaching - clinical practice activity 4h

Textbook and teaching resource

-W.B.Kibler: Clinical implications of scapular dyskinesis in shoulder injury: the 2013 consensus statement from the 'scapular summit' – group.bmj.com 2014

-C.Griffin: Management of the hemiplegic shoulder complex – Top Stroke Rehabil. 2014

- M.A. Finley: Effect of sitting posture on 3-dimensional scapular kinematics measured by skin-mounted electromagnetic tracking sensors – Phys.Med.Rehabil. 2003

-E.R.Kandel: Principles of neural science – 5^o Edition – McGraw-Hill Companies 2013
