COURSE SYLLABUS

Visual Perception

2627-3-E3002Q040

Aims

The class aims to provide the basic psychological and psychophysiological knowledge necessary to understand the functioning of visual perception. It provides the tools for a fruitful interaction with other professional figures (psychologists, psychophysiologicals and neuropsychologists) for clinical and research purposes.

Contents

Psychological bases of visual perception:

- Research methods in psychology of visual perception
- Theories and psychological models of visual perception
- Visual-spatial attention and eye movements

Psycho-physiological bases of visual perception:

- Psycho-physiological bases of visual perception of characteristics (color, clarity, shape, depth, movement) and of visual recognition of objects
- Anatomic-functional bases of vision, perception, and attention
- Neuropsychology of vision, perception, and attention

Detailed program

The detailed program will be published as soon as possible.

Prerequisites

Receptive and productive language skills
Analytical abilities in understanding and reasoning
The capacity of synthesis and content processing

Teaching form

Information on the teaching form will be published as soon as possible.

Textbook and teaching resource

Information on the textbook and/or other teaching resources will be published as soon as possible.

Semester

third year, first semester

Assessment method

Information on the assessment method will be published as soon as possible.

Office hours

Information on the office hours will be published as soon as possible.
