

Strumentazione Astronomica: Radioastronomia

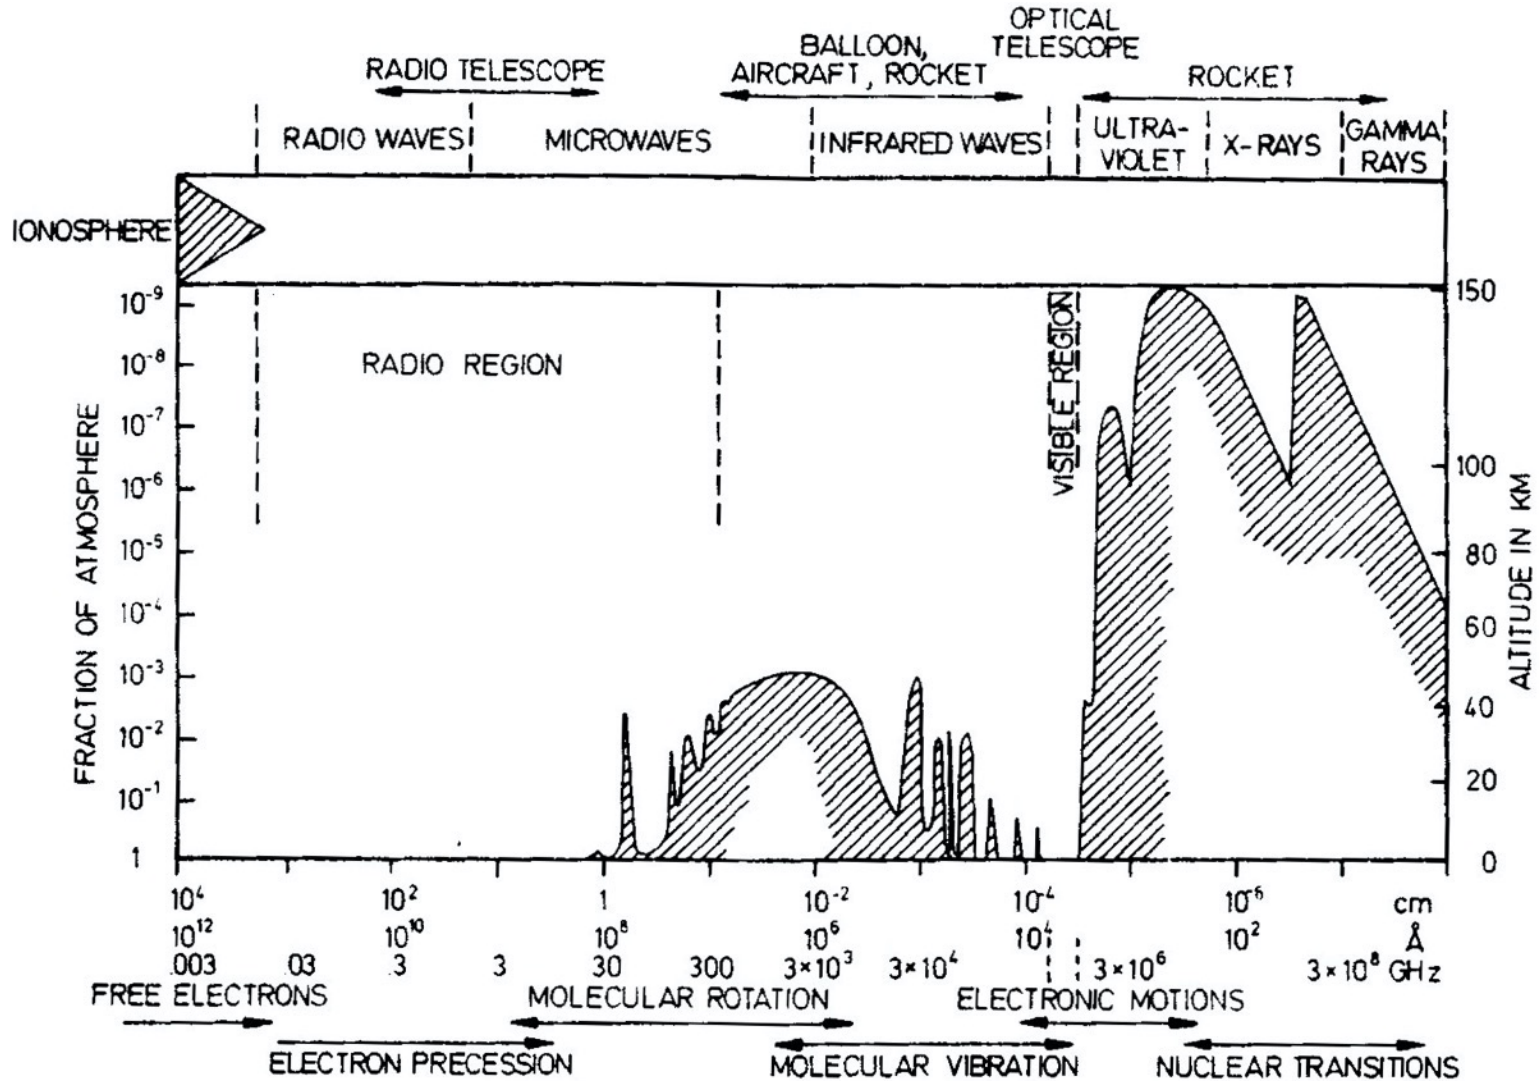

Fig. 1.1. The transmission of the earth's atmosphere for electromagnetic radiation. The diagram gives the height in the atmosphere at which the radiation is attenuated by a factor $1/2$

Strumentazione Astronomica: Radioastronomia

In questa lezione vediamo da vicino due strumenti che per le loro caratteristiche rappresentano lo stato dell'arte.

ALMA (Atacama Large Millimeter Array) operante tra 100 GHz e 1 THz

SKA (Square Kilometer Array) operante tra 70 MHz e 10 GHz

Strumentazione Astronomica: Radioastronomia

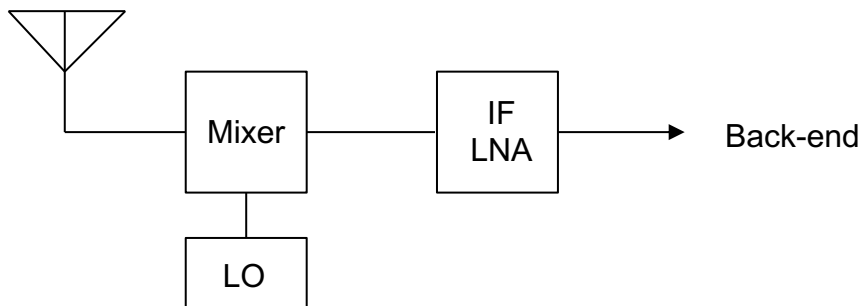

Fig. 7-2. A superheterodyne radio-telescope receiver.

Se la frequenza RF è troppo alta (>100 GHz) gli amplificatori di testa, sebbene siano definiti LNA (Low Noise Amplifier), sono troppo rumorosi.

Soluzione: spostare il mixer prima dell'LNA.

Problema: i mixer convenzionali (a stato solido) non sono sufficientemente sensibili.

Strumentazione Astronomica: Radioastronomia

Si parte da una giunzione Josephson costituita da un tristrato superconduttore-isolante-superconduttore (SIS)

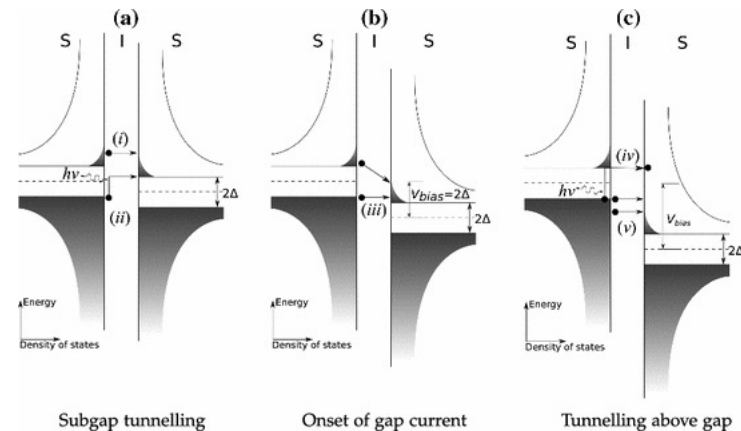

Tipicamente Nb-AIO_x-Nb con AIO_x spesso pochi atomi

Si usa Nb perché superconduttivo sotto i 9.2K

Elettroni e coppie di Cooper possono attraversare la barriera per effetto tunnel.

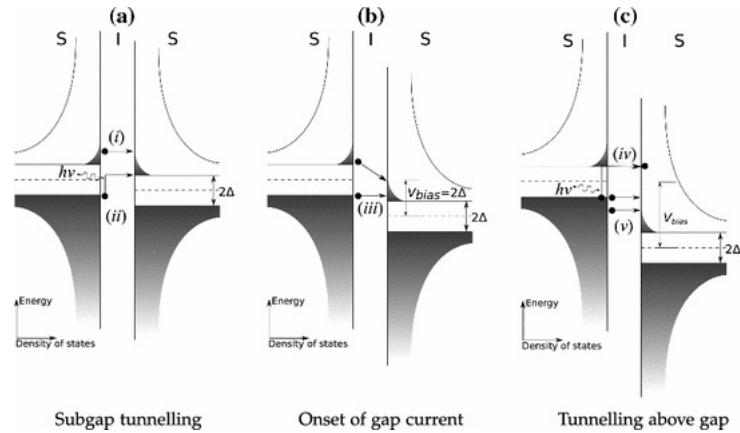

Nei materiali superconduttori allo stato superconduttivo gli elettroni formano coppie debolmente legate (coppie di Cooper) formate da due elettroni.

Queste coppie si comportano da bosoni (avendo spin 0 o 1) e possono occupare lo stato energetico più basso, uguale per tutte le coppie.

Strumentazione Astronomica: Radioastronomia

In assenza di differenza di potenziale ai capi della giunzione avviene esclusivamente il tunnel delle coppie di Cooper (a parte quello delle *quasiparticelle* che sono presenti per agitazione termica).

Applicando una differenza di potenziale ai capi della giunzione la corrente non aumenta sino ad un potenziale pari all'energia di legame delle coppie $2\Delta/e$, quando le coppie si scindono e possono effettuare il tunnel.

Strumentazione Astronomica: Radioastronomia

In presenza di un campo di microonde (Oscillatore Locale + RF) il tunnel avviene a tensioni più basse (tunnel *foto-assistito*) e l'ampiezza della corrente che attraversa la barriera è modulata dalla somma e dalla differenza della frequenza dei fotoni e dell'oscillatore locale.

Ne risulta perciò un segnale a frequenza intermedia (IF) come in un mixer tradizionale.

Strumentazione Astronomica: Radioastronomia

Esempi di front-end SIS dove sono visibili le antenne a tromba che raccolgono l'RF (e spesso anche l'LO), l'uscita dell'IF e le bobine di soppressione della corrente Josephson.

al fuoco Nasmyth

Strumentazione Astronomica: Radioastronomia

Criostato che ospita le cartucce con i differenti ricevitori raffreddati dal criogeneratore.

Strumentazione Astronomica: Radioastronomia

Band 3 (“3mm”)

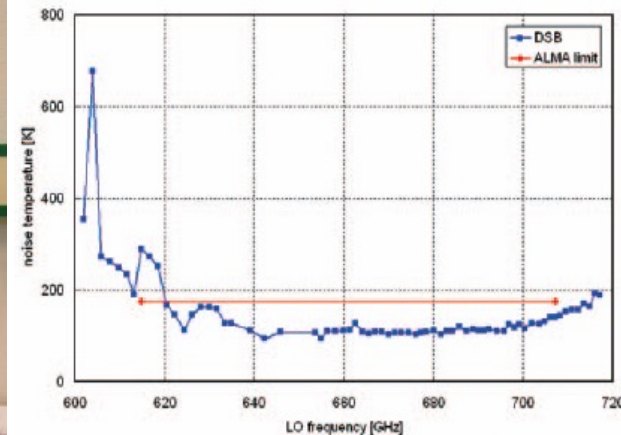

Esempio di cartridge (letteralmente ‘cartucce’) di front-end di ALMA

Da notare la temperatura di rumore (TN).

I migliori LNA hanno una TN che scala circa come 0.5K/GHz .

Nel caso della Banda 3 il rumore è un fattore 2 più basso.

Sopra ai 150-200 GHz i migliori LNA hanno TN di centinaia di K

Band 9 (“450 μm ”)

Strumentazione Astronomica: Radioastronomia

In questo modello solido è messo in evidenza il sistema criogenico. Ci sarà una lezione dedicata alle tecniche criogeniche.

Strumentazione Astronomica: Radioastronomia

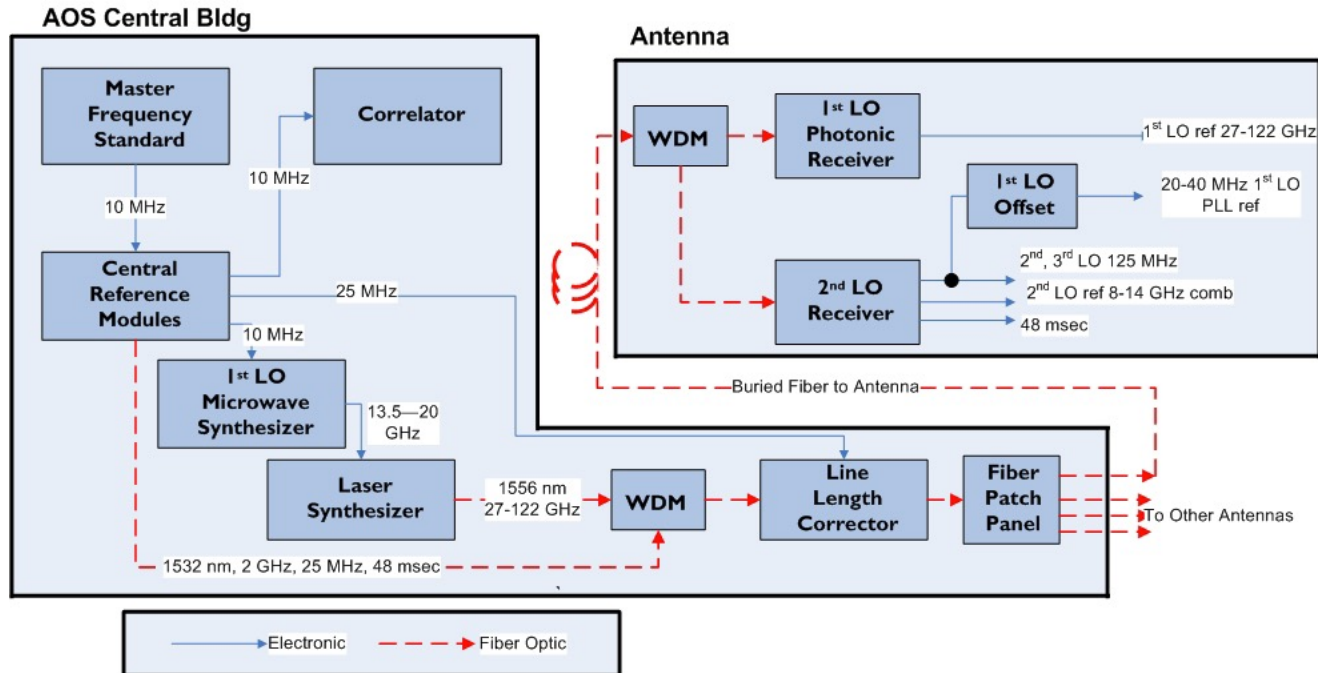

Modello solido di un front-end di ALMA con ingresso dell'LO da un secondo illuminatore.

Strumentazione Astronomica: Radioastronomia

Come mantenere la coerenza fra le antenne?

Un oscillatore locale distribuito, a queste frequenze e a queste distanze, è impraticabile (insertion loss).

Si ricorre ad un sistema basato sui battimenti di due laser IR che propagano in fibra ottica sino ad ogni antenna.

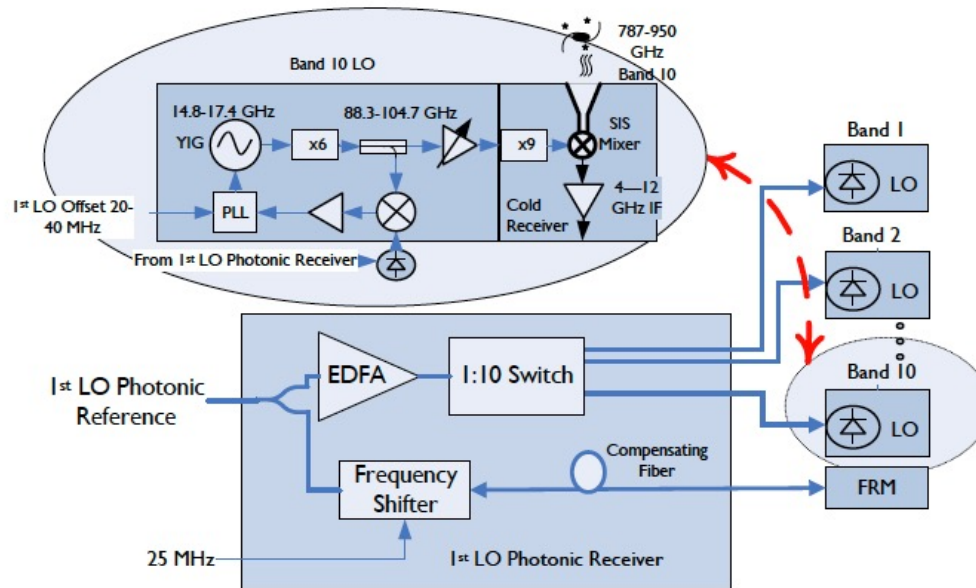

Strumentazione Astronomica: Radioastronomia

Come mantenere la coerenza fra le antenne?

Timeline

Five stages of development of the SKA are planned:

2008-2012	System design and costing.
2012	Site decision.
2013-2015	Detailed design and production engineering.
2016	Initial construction.
2019	First science.
2023	Completion of construction and commissioning.
2024	Full operation.

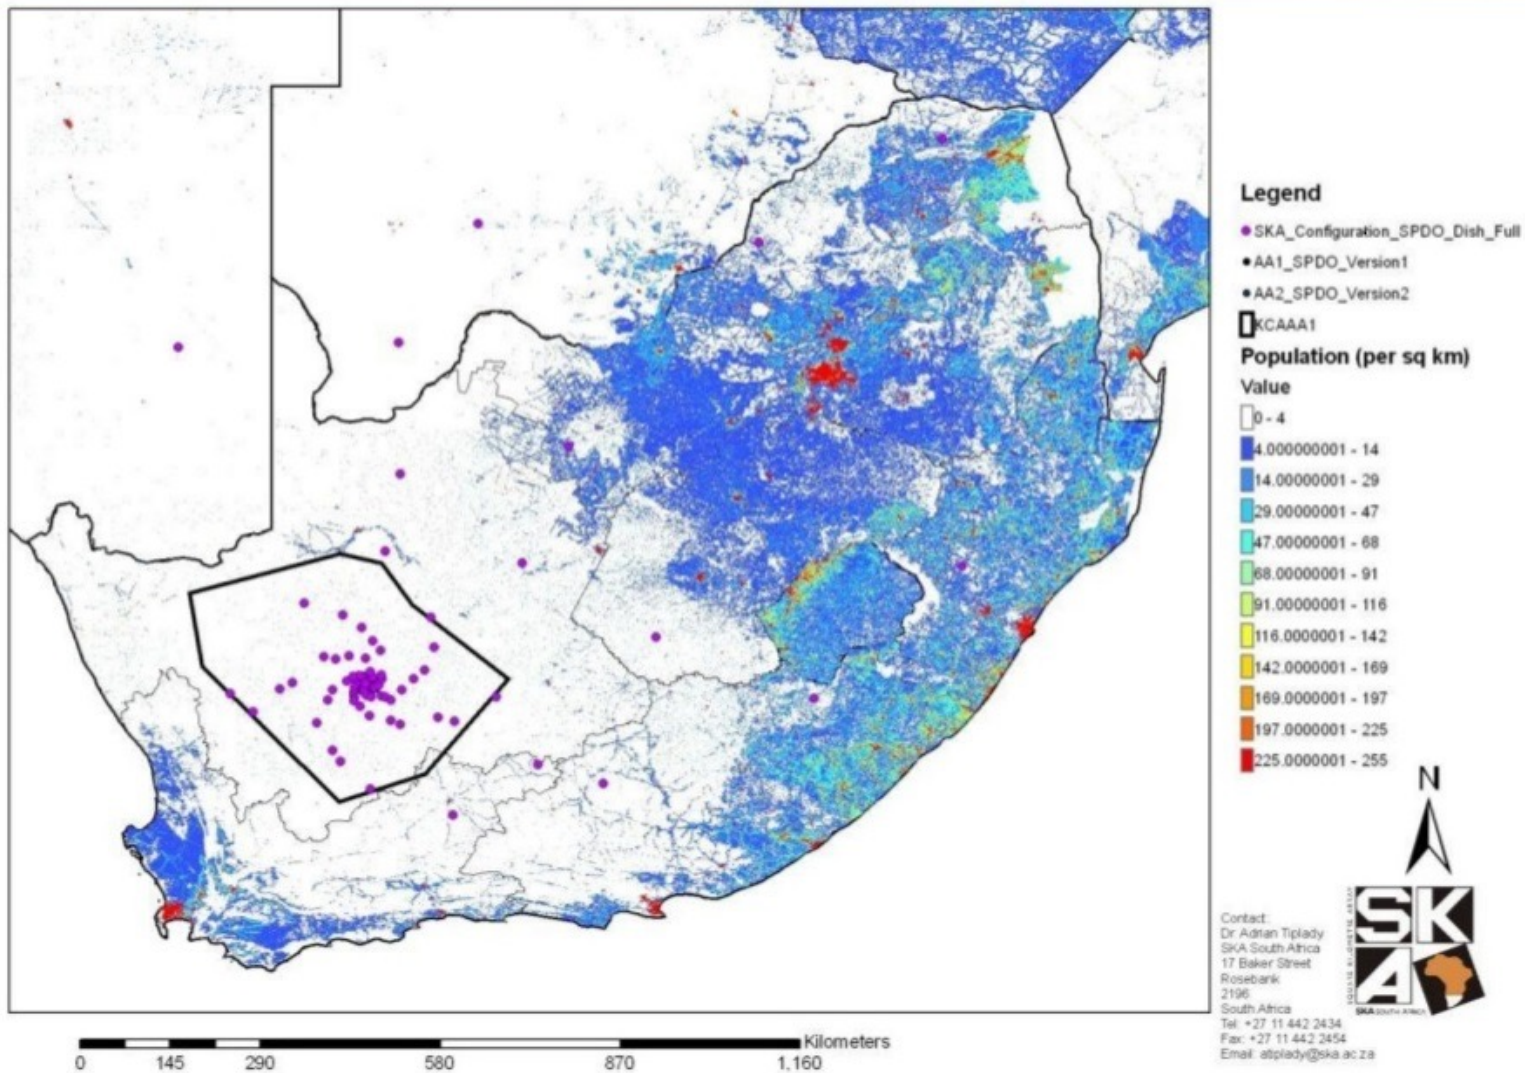

The ambition and scale of the SKA projects demand innovative technical developments.

★ The SKA will use 3 000 dishes, each about 15 m wide. Two other types of receptor, known as aperture arrays, will also be used to observe very large areas of the sky simultaneously. The antennas will cover the frequency range 70 MHz to 10 GHz (4 m to 3 cm wavelength).

Strumentazione Astronomica: Radioastronomia

Strumentazione Astronomica: Radioastronomia

SKA1 MID - the SKA's mid-frequency instrument

The Square Kilometre Array (SKA) will be the world's largest radio telescope, revolutionising our understanding of the Universe. The SKA will be built in two phases - SKA1 and SKA2 - starting in 2018, with SKA1 representing a fraction of the full SKA. SKA1 will include two instruments - SKA1 MID and SKA1 LOW - observing the Universe at different frequencies.

Location:
South Africa

Frequency range:
350 MHz to
14 GHz

~200 dishes
(including 64 MeerKAT dishes)

Total collecting area:
33,000m²

or
126 tennis courts

Maximum distance between dishes:
150km

Total raw data output:
2 terabytes per second
62 exabytes per year

x340,000

Enough to fill
340,000
average laptops with content **every day**

Compared to the JVLA, the current best similar instrument in the world:

4x
the resolution

5x
more sensitive

60x

Band #.	Band (GHz)	RF BW	IF BW (GHz)	Antenna & Feed Efficiency
Band 1	0.35 – 1.05	3:1	1	0.65 @ 400 MHz 0.78 above 600 MHz
Band 2	0.95 – 1.76	1.85:1	1	0.78
Band 3	1.65 – 3.05	1.85:1	2.5	0.78
Band 4	2.8 – 5.18	1.85:1	2.5	0.78
Band 5	4.6 – 13.8	3:1	2.5	0.78 @ 8 GHz 0.7 above 8 GHz

Banda 1 (a sinistra, riproduzione con CAD) e banda 2 (sopra, su banco di prova per testare il rumore)

SKA 1

Figure 12 The generic SKA1-mid configuration superimposed on the site topology. No attempt here has been made to adapt to the landscape or other mask components. The black dots are SKA dishes; blue are MeerKAT dishes. The black dots are drawn from a 250-dish configuration and represent an over-density in the core.

SKA 2

Figure 13 The generic SKA2 configuration with the SKA1 configuration embedded in a position in which the antenna densities of the two configurations are matched. Red dots are SKA1; blue are MeerKAT; black are SKA2 antennas.

Strumentazione Astronomica: Radioastronomia

Mid-Frequency Aperture Array

Andranno a coprire la frequenza tra 200 – 500 MHz

Strumentazione Astronomica: Radioastronomia

Si tratta di una sorta di dipoli ad anello per funzionare su una banda più larga.
Prelevano entrambe le polarizzazioni che vengono digitalizzate e registrate singolarmente per ogni antenna.

Strumentazione Astronomica: Radioastronomia

La strumentazione di SKA funziona sul principio dei phased array.

Impostando le differenze di fase tra i segnali acquisiti dalle singole antenne è possibile formare ed orientare il beam sintetico in una direzione qualunque.

Questo si può fare anche a posteriori, sui segnali acquisiti e digitalizzati.

Si potrà, con gli stessi dati d'archivio, fare osservazioni di sorgenti in punti completamente diversi in cielo.

Strumentazione Astronomica: Radioastronomia

SKA1 LOW - the SKA's low-frequency instrument

The Square Kilometre Array (SKA) will be the world's largest radio telescope, revolutionising our understanding of the Universe. The SKA will be built in two phases - SKA1 and SKA2 - starting in 2018, with SKA1 representing a fraction of the full SKA. SKA1 will include two instruments - SKA1 MID and SKA1 LOW - observing the Universe at different frequencies.

Square Kilometre Array

@SKA_telescope

The Square Kilometre Array

How does SKA1 compare with the world's biggest radio telescopes?

The Square Kilometre Array (SKA) will be the world's largest radio telescope, revolutionising our understanding of the Universe. The SKA will be built in two phases - SKA1 and SKA2 - starting in 2018, with SKA1 representing a fraction of the full SKA. SKA1 will include two instruments - SKA1 MID and SKA1 LOW - observing the Universe at different frequencies.

A telescope's capacity to receive faint signals - called sensitivity - depends on its collecting area, the bigger the better. But just like you can't compare radio telescopes and optical telescopes, comparison only works between telescopes working in similar frequencies, hence the different categories above.

The collecting area is just one aspect of a telescope's capability though. Arrays like the SKA have an advantage over single dish telescopes: by being spread over long distances, they simulate a virtual dish the size of that distance and so can see smaller details in the sky, this is called resolution.

How will SKA1 be better than today's best radio telescopes?

Astronomers assess a telescope's performance by looking at three factors - **resolution**, **sensitivity**, and **survey speed**. With its sheer size and large number of antennas, the SKA will provide a giant leap in all three compared to existing radio telescopes, enabling it to revolutionise our understanding of the Universe.

The **Square Kilometre Array (SKA)** will be the world's largest radio telescope. It will be built in two phases - SKA1 and SKA2 - starting in 2018, with SKA1 representing a fraction of the full SKA. SKA1 will include two instruments - **SKA1 MID** and **SKA1 LOW** - observing the Universe at different frequencies.

SKA1 LOW x1.2 LOFAR NL
SKA1 MID x4 JVLA

RESOLUTION

Thanks to its size, the SKA will see smaller details, making radio images less blurry, like reading glasses help distinguish smaller letters.

SKA1 LOW Australia **SKA1 MID** South Africa

SKA1 LOW x135 LOFAR NL
SKA1 MID x60 JVLA

SURVEY SPEED

Thanks to its sensitivity and ability to see a larger area of the sky at once, the SKA will be able to observe more of the sky in a given time and so map the sky faster.

SKA1 LOW x8 LOFAR NL
SKA1 MID x5 JVLA

SENSITIVITY

Thanks to its many antennas, the SKA will see fainter details, like a long-exposure photograph at night reveals details the eye can't see.
