Relationship among connectives

Davide	Ciucci	(DISCo)
--------	--------	---------

### Introduction

- Problem: assign a logical value to propositions about partial recursive functions
- Partial recursive functions  $f : \mathbb{N}^n \mapsto \mathbb{N}$ , can be defined only on a subset of  $\mathbb{N}^n$
- Kleene defines two logics: weak and strong
- In the strong version, the third value is interpreted as unknown: is a category into which we can regard any proposition as falling, whose value we either do not know or choose for the moment to disregard and it does not then exclude the other two possibilities true and false.

### Introduction

- Problem: assign a logical value to propositions about partial recursive functions
- Partial recursive functions *f* : N<sup>n</sup> → N, can be defined only on a subset of N<sup>n</sup>
- Kleene defines two logics: weak and strong
- In the strong version, the third value is interpreted as unknown: is a category into which we can regard any proposition as falling, whose value we either do not know or choose for the moment to disregard and it does not then exclude the other two possibilities true and false.

#### Truth values

### • Boolean truth values $\{f, t\}$ , Kleene truth values $\{F, T, U\}$

- T: I know that the Boolean truth value of a proposition is true  $T = \{t\}$
- F I know that the Boolean truth value of a proposition is false  $F = \{f\}$
- U: I do not know the Boolean truth value of a proposition  $U = \{f, t\}$

The connectives are defined through operations on sets

### Truth values

- Boolean truth values  $\{f, t\}$ , Kleene truth values  $\{F, T, U\}$
- T: I know that the Boolean truth value of a proposition is true  $T = \{t\}$
- F I know that the Boolean truth value of a proposition is false  $F = \{f\}$
- U: I do not know the Boolean truth value of a proposition  $U = \{f, t\}$

The connectives are defined through operations on sets

### Truth values

- Boolean truth values  $\{f, t\}$ , Kleene truth values  $\{F, T, U\}$
- T: I know that the Boolean truth value of a proposition is true  $T = \{t\}$
- F I know that the Boolean truth value of a proposition is false  $F = \{f\}$
- U: I do not know the Boolean truth value of a proposition  $U = \{f, t\}$

The connectives are defined through operations on sets

### Truth values

- Boolean truth values  $\{f, t\}$ , Kleene truth values  $\{F, T, U\}$
- T: I know that the Boolean truth value of a proposition is true  $T = \{t\}$
- F I know that the Boolean truth value of a proposition is false  $F = \{f\}$
- U: I do not know the Boolean truth value of a proposition  $U = \{f, t\}$

The connectives are defined through operations on sets

#### Conjunction

### $F \sqcap T = \{f\} \sqcap \{t\} = \{f \land t\} = \{f\} = F$ $F \sqcap U = \{f\} \sqcap \{f, t\} = \{f \land f, f \land t\} = \{f\} = F$ $T \sqcap U = \{t\} \sqcap \{f, t\} = \{f \land t, t \land t\} = \{f, t\} = U$

#### **Disjunction:**

 $F \sqcup U = \{f\} \sqcup \{f, t\} = \{f \lor f, f \lor t\} = \{f, t\} = U$  $T \sqcup U = \{t\} \sqcup \{f, t\} = \{t \lor t, t \land f\} = \{t\} = T$  $U \sqcup U = \{f, t\} \sqcup \{f, t\} = \{f \lor f, f \lor t, t \lor t\} = \{f, t\} = U$ 

Davide Ciucci (DISCo)

#### Conjunction

## $F \sqcap T = \{f\} \sqcap \{t\} = \{f \land t\} = \{f\} = F$ $F \sqcap U = \{f\} \sqcap \{f, t\} = \{f \land f, f \land t\} = \{f\} = F$ $T \sqcap U = \{t\} \sqcap \{f, t\} = \{f \land t, t \land t\} = \{f, t\} = U$

#### Disjunction:

 $F \sqcup U = \{f\} \sqcup \{f, t\} = \{f \lor f, f \lor t\} = \{f, t\} = U$  $T \sqcup U = \{t\} \sqcup \{f, t\} = \{t \lor t, t \land f\} = \{t\} = T$  $U \sqcup U = \{f, t\} \sqcup \{f, t\} = \{f \lor f, f \lor t, t \lor t\} = \{f, t\} = U$ 

Davide Ciucci (DISCo)

#### Conjunction

$$F \sqcap T = \{f\} \sqcap \{t\} = \{f \land t\} = \{f\} = F$$
  

$$F \sqcap U = \{f\} \sqcap \{f, t\} = \{f \land f, f \land t\} = \{f\} = F$$
  

$$T \sqcap U = \{t\} \sqcap \{f, t\} = \{f \land t, t \land t\} = \{f, t\} = U$$

**Disjunction:** 

. . .

 $F \sqcup U = \{f\} \sqcup \{f, t\} = \{f \lor f, f \lor t\} = \{f, t\} = U$  $T \sqcup U = \{t\} \sqcup \{f, t\} = \{t \lor t, t \land f\} = \{t\} = T$  $U \sqcup U = \{f, t\} \sqcup \{f, t\} = \{f \lor f, f \lor t, t \lor t\} = \{f, t\} = U$

Relationship among connectives

#### Truth tables

Negation U' = U, F' = T, T' = F

イロト イヨト イヨト イヨト

#### Implication

#### $a \rightarrow_{K} b := a' \sqcup b$

$\rightarrow_{K}$	F	U	Т
F	Т	Т	Т
U	U	U	Т
Т	F	U	Т

Modus ponens holds: if *a* is true and  $a \rightarrow_K b$  is true then *b* is true

Davide Ciucci	(DISCo)
---------------	---------

イロト イポト イヨト イヨト

#### Implication

 $a \rightarrow_{K} b := a' \sqcup b$ 

Modus ponens holds: if *a* is true and  $a \rightarrow_{\mathcal{K}} b$  is true then *b* is true

Davide Ciucci	(DISCo)
---------------	---------

#### Some comments

- If we map
  - F to 0
  - T to 1
  - U to  $\frac{1}{2}$

then  $\sqcap$  corresponds to min,  $\sqcup$  to max and the negation of x to 1 - x

- there are no tautologies
  - $\not\exists$  a formula *P* such that  $\forall v, v(P) = T$
  - If to all variables we assign U then by we get only U (and never T)

#### Some comments

- If we map
  - F to 0
  - T to 1
  - U to  $\frac{1}{2}$

then  $\Box$  corresponds to min,  $\Box$  to max and the negation of x to 1 - x

- there are no tautologies
  - $\not\exists$  a formula *P* such that  $\forall v, v(P) = T$
  - If to all variables we assign U then by we get only U (and never T)

### Is "Unknown" a truth value?

- In practice, <sup>1</sup>/<sub>2</sub> is used to model the idea that the truth-value of a Boolean proposition is unknown
- "'Unknown" is in conflict with "Known to be true" (*T*) and "Known to be false (*F*), not with "true" (*t*) and "false" (*f*)
- One must distinguish between two levels:
  - Ontic values: v(p): true (t), false (f)
  - Epistemic values  $\mathbf{v}(p)$ : certainly true  $T = \{t\}$ , certainly false  $F = \{f\}$ , unknown  $T = \{f, t\}$
- The three-valued v(p) informs about the state of knowledge about the truth v(p) of a Boolean proposition

### Is "Unknown" a truth value?

- In practice, <sup>1</sup>/<sub>2</sub> is used to model the idea that the truth-value of a Boolean proposition is unknown
- "'Unknown" is in conflict with "Known to be true" (*T*) and "Known to be false (*F*), not with "true" (*t*) and "false" (*f*)
- One must distinguish between two levels:
  - Ontic values: v(p): true (t), false (f)
  - Epistemic values v(p): certainly true T = {t}, certainly false F = {f}, unknown T = {f, t}
- The three-valued v(p) informs about the state of knowledge about the truth v(p) of a Boolean proposition

### Is "Unknown" a truth value?

- In practice, <sup>1</sup>/<sub>2</sub> is used to model the idea that the truth-value of a Boolean proposition is unknown
- "'Unknown" is in conflict with "Known to be true" (*T*) and "Known to be false (*F*), not with "true" (*t*) and "false" (*f*)
- One must distinguish between two levels:
  - Ontic values: v(p): true (t), false (f)
  - Epistemic values v(p): certainly true T = {t}, certainly false F = {f}, unknown T = {f, t}
- The three-valued v(p) informs about the state of knowledge about the truth v(p) of a Boolean proposition

### Priest Logic

- $\frac{1}{2} =$ inconsistent, paradoxical, both true and false
- Kleene, with two designated values
  - Connectives: min, max,  $\neg$
  - Designated truth values: <sup>1</sup>/<sub>2</sub>, 1 (a logical formula is considered a tautology if it evaluates to a designated truth value)
  - All Boolean tautologies are valid, no modus ponens

### Kleene logic and SQL

# • Let us suppose to have two relations Parts and Suppliers $\frac{S_n | \text{City}}{S1 | \text{London}} \frac{P_n | \text{City}}{P1 | \text{NULL}}$

Query: select all the pairs (S<sub>n</sub>, P<sub>n</sub>) such that "the city of the supplier is different from the city of the part or the city of the part is different from Paris"
 SELECT Suppliers.Sn, Parts.Pn
 FROM. Suppliers, Parts
 WHERE Suppliers.city <> Parts.city OR Parts.city
 <> 'Paris'

(日)

### Kleene logic and SQL

Let us suppose to have two relations Parts and Suppliers

$S_n$	City	$P_n$	City
S1	London	P1	NULL

• Query: select all the pairs (*S<sub>n</sub>*, *P<sub>n</sub>*) such that "the city of the supplier is different from the city of the part or the city of the part is different from Paris"

```
SELECT Suppliers.Sn, Parts.Pn
FROM. Suppliers, Parts
WHERE Suppliers.city <> Parts.city OR Parts.city
<> 'Paris'
```

### Query result

#### $\bullet\,$ Kleene logic is used $\rightarrow$ the answer is NULL

- Let us suppose to know the value of *Parts.City* and consider the different cases:
  - Paris
  - London
  - Any other city
- In all cases the answer is (P1,S1)

### Query result

- $\bullet\,$  Kleene logic is used  $\rightarrow$  the answer is NULL
- Let us suppose to know the value of *Parts.City* and consider the different cases:
  - Paris
  - London
  - Any other city
- In all cases the answer is (P1,S1)

### Query result

- $\bullet\,$  Kleene logic is used  $\rightarrow\,$  the answer is NULL
- Let us suppose to know the value of *Parts*. *City* and consider the different cases:
  - Paris
  - London
  - Any other city
- In all cases the answer is (P1,S1)
# Three-valued logic applications

There are several situations where three valued logics arise or are imposed:

- NULL value in databases
  - Usually Kleene (min, max) logic is used (SQL)
  - Critics: does not respect the semantics in queries
  - There can be different semantic for NULL
- Rough sets: lower approximation (1), exterior region (0), boundary (1/2) (as we will discuss)
- Shadowed sets: an approximation of a fuzzy set through {0, [0, 1], 1}
- Three-way decision: accept, reject, undecided

# **Outline**

Relationship among connectives

Davide Ciucci	(DISCo)
---------------	---------

#### Minimal requirement: it should act as a Boolean conjunction on $\{0, 1\}$

Still 243(3<sup>5</sup>) possibilities.

We adopt a more stringent definition and require monotonicity

#### Definition

A conjunction on  $\mathbf{3} = \{F, N, T\}$  is a binary mapping  $*: \mathbf{3} \times \mathbf{3} \mapsto \mathbf{3}$  such that

- If  $x \le y$  then  $x * z \le y * z$  (left monotonicity)
- If  $x \le y$  then  $z * x \le z * y$  (right monotonicity)

If F \* F = F \* T = T \* F = F and T \* T = T (conformity with Boolean logic)

Note that N \* F = F \* N = F

Some conjunctions are not covered: Kleene weak logic, McCarthy logic, . .

Davide Ciucci	(DISCo)

# **Implications**

Conformity with Boolean logic, monotonicity

#### Definition

An implication on **3** is a binary mapping  $\rightarrow$ : **3**  $\times$  **3**  $\mapsto$  **3** such that

$$If x \leq y then y \rightarrow z \leq x \rightarrow z$$

$$If x \leq y then z \rightarrow x \leq z \rightarrow y$$

#### Other important properties

$$T \rightarrow x = x$$
 (left neutrality or border condition)

(a)  $x \to y = T$  iff  $x \le y$  (ordering property)

Davide Ciucci	(DISCo)

#### 3 *Relationship among connectives*

Davide Ciucci	(DISCo)
---------------	---------

# **Relationships**

# Standard ways to obtain conjunction from implications and vice versa (Dubois, Prade 1984)

Material implication  $\mathcal{E}$ Exchange  $\mathcal{A}$ Contraposition  $\mathcal{V}$ Residuation  $\mathcal{I}$ 

 $a * b = \neg (a \rightarrow \neg b)$ a \*' b = b \* a $a \rightarrow' b = \neg b \rightarrow \neg a$ 

 $a \rightarrow' b = egin{cases} 0 & ext{if there is no } s ext{ such that } a st s \leq b \ \sup\{s : a st s \leq b\} & ext{otherwise} \end{cases}$ 

# **Relationships**

Standard ways to obtain conjunction from implications and vice versa (Dubois, Prade 1984)

Material implication SExchange AContraposition VResiduation I

 $a * b = \neg (a \rightarrow \neg b)$ a \*' b = b \* a $a \rightarrow' b = \neg b \rightarrow \neg a$ 

< 日 > < 同 > < 回 > < 回 > < □ > <

 $a \rightarrow' b = \begin{cases} 0 & \text{if there is no } s \text{ such that } a * s \leq b \\ \sup\{s : a * s \leq b\} & \text{otherwise} \end{cases}$ 

Let  $i \in \{1, 2, 11\}$  then

- Łukasiewicz logic ( $\rightarrow_{11}, *_{11}, +_{11}, \neg$ )
- Sobociński logic (→2, \*2, +2, ¬)
  - $+_2$  can be defined as  $a +_2 b := \neg a \rightarrow_2 b$ , designated values are T, N
  - The third value means irrelevant
  - Conjunction  $*_2$  is a discrete uninorm with N as neutral element and implication  $\rightarrow_2$  its residuum.

Let  $i \in \{1, 2, 11\}$  then

- Łukasiewicz logic ( $\rightarrow_{11}, *_{11}, +_{11}, \neg$ )
- Sobociński logic  $(\rightarrow_2, *_2, +_2, \neg)$ 
  - $+_2$  can be defined as  $a +_2 b := \neg a \rightarrow_2 b$ , designated values are T, N
  - The third value means irrelevant
  - Conjunction \*<sub>2</sub> is a discrete uninorm with N as neutral element and implication →<sub>2</sub> its residuum.

- Gödel (intuitionistic) logic (→10, \*5(min), max, ~) on three values, also known as logic of here-and-there in logic programming
- Jaskowski logic ( $\rightarrow_4, *_5(min), max, \neg$ ) has been studied by several authors in the field of paraconsistent logic. The designated values are *N* and *T*.

Third value: inconsistent, paradoxical

It is equivalent to Sobocinski logic through the following definitions:

$$p \rightarrow_S q := (p \rightarrow_J q) \land (\neg q \rightarrow_J \neg p)$$
  
 $p \rightarrow_J q := q \lor (p \rightarrow_S q)$ 

Davide Ciucci (DISCo)

- Gödel (intuitionistic) logic (→10, \*5(min), max, ~) on three values, also known as logic of here-and-there in logic programming
- Jaskowski logic (→4, \*5(min), max, ¬) has been studied by several authors in the field of paraconsistent logic. The designated values are N and T.

Third value: inconsistent, paradoxical

It is equivalent to Sobocinski logic through the following definitions:

$$p \rightarrow_S q := (p \rightarrow_J q) \land (\neg q \rightarrow_J \neg p)$$
  
 $p \rightarrow_J q := q \lor (p \rightarrow_S q)$ 

< ロ > < 同 > < 回 > < 回 >

### Translations in modal logic

### The translation of Implications

Implication	Translation $\mathcal{T}_1(a \rightarrow b)$
1–5 (Sobocinski, Jaskowski,Kleene)	$\Diamond a \Rightarrow \Box b$
6,7 (Sette)	$\Diamond a \Rightarrow \Diamond b$
8	$\Box a \Rightarrow \Diamond b$
9,12 (Nelson, Bochvar)	$\Box a \Rightarrow \Box b$
10,11,13,1	$(\Box a \land \Box b) \land (\land a \land \land b)$
(Gödel, Łukasiewicz, Gaines-Rescher)	$(\Box a \Rightarrow \Box b) \land (\Diamond a \Rightarrow \Diamond b)$

• The interpretation of each logic is clear
