1. The nervous system

Edwin Smith Papyrus, 1600 B.C.

Brainbow

from Smith, S.J. Circuit Reconstruction Tools Today. Curr Opin Neurobiol 2007
https://www.ncbi.nlm.nih.gov/pmc/articles/PMC1885915/

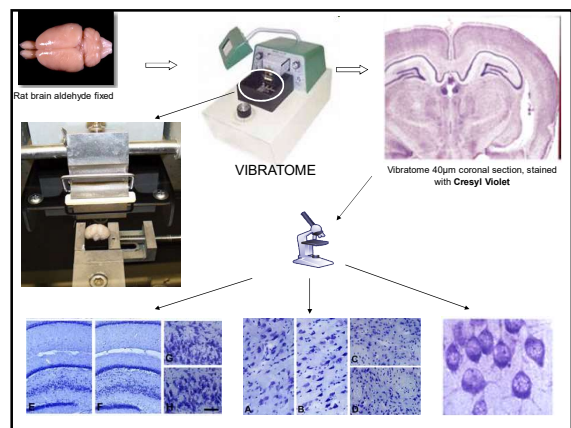

1. The nervous system

«The human brain ...is the most complicated organization of matter that we know»
Isaac Asimov, 1986

«Mind, a mysterious form of matter secreted by the brain»
Ambrose Bierce, 1911

TAKE HOME MESSAGE:
– THE NERVOUS SYSTEM IS EXTREMELY COMPLEX AND HIGHLY ORDERED –

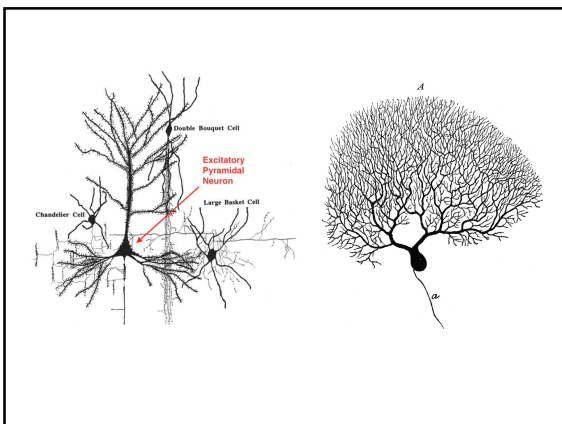

«Like the entomologist hunting for brightly coloured butterflies, my attention was drawn to the flower garden of the gray matter, which contained cells with delicate and elegant forms, the mysterious butterflies of the soul»
Santiago Ramón y Cajal, 1894

A composite image featuring a portrait of Santiago Ramón y Cajal on the left and two of his detailed drawings of neurons on the right.

2. The neuron doctrine

**TAKE HOME MESSAGE:
– NEURONS ARE THE
FONDAMENTAL
COMPONENTS OF THE
NERVOUS SYSTEM –**

A 3D rendering of a human brain with a network of neurons overlaid on it.

3. Glial cells

Hey, why doesn't anyone talk about me!

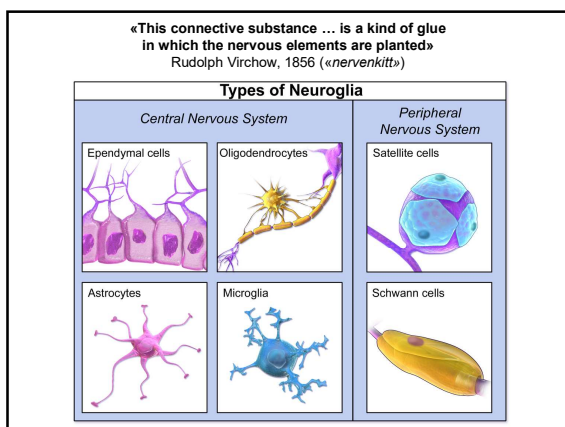

You don't do anything. That's why.

A diagram comparing a Glial Cell and a Neuron. Below it is a photograph of white matter.

 Neuron 2012 May 24; 74(4): 691-705. doi:10.1016/j.neuron.2012.03.026

Microglia Sculpt Postnatal Neural Circuits in an Activity and Complement-Dependent Manner

Dorothy P Schafer¹, Emily K Lehman^{1,2}, Amanda G Kautzman^{1,2}, Ryuta Koyama¹, Alan R Mardinly³, Ryo Yamasaki⁴, Richard M Ransohoff⁵, Michael E Greenberg², Ben A Barres², and Beth Stevens¹

...while past work has focused on the role of these cells during disease, recent imaging studies reveal dynamic interactions between microglia and synaptic elements in the healthy brain. Despite these intriguing observations, the precise function of microglia at remodeling synapses and the mechanisms that underlie microglia-synapse interactions remain elusive...

Figure 4. Microglia engulf presynaptic elements undergoing active synaptic pruning

PRR, pattern recognition receptors
 ...able to trigger inflammatory pathways

DAMP, danger-associated molecular patterns
 ...i.e., *misfolded* proteins

PAMP, pathogen-associated molecular patterns
 ...i.e., *microbial* molecules

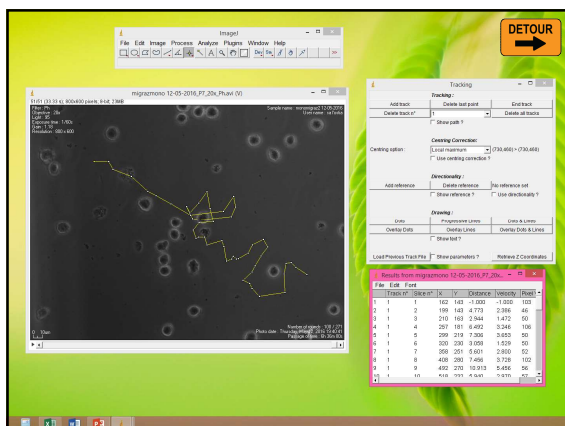

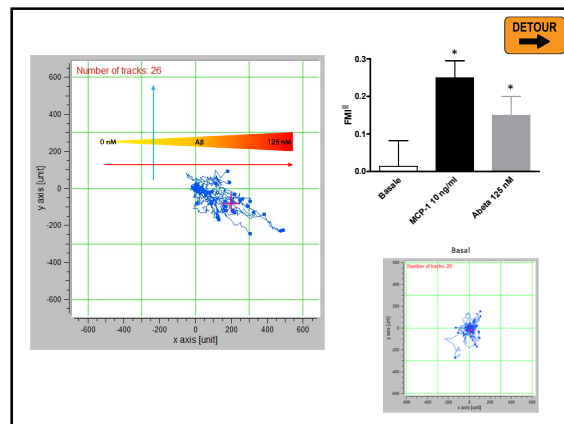

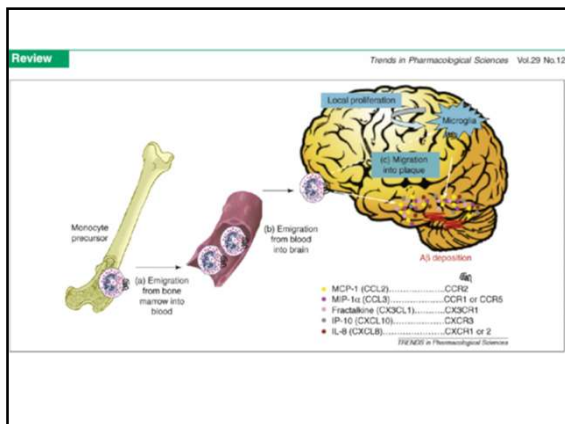

M2-like
 • Neurotrophic factors
 • ARG1, IL 4 and IRE
 • Prostate secretions
 • Phagocytosis

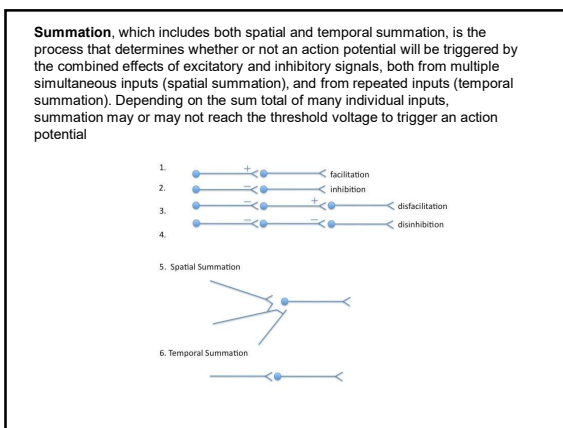

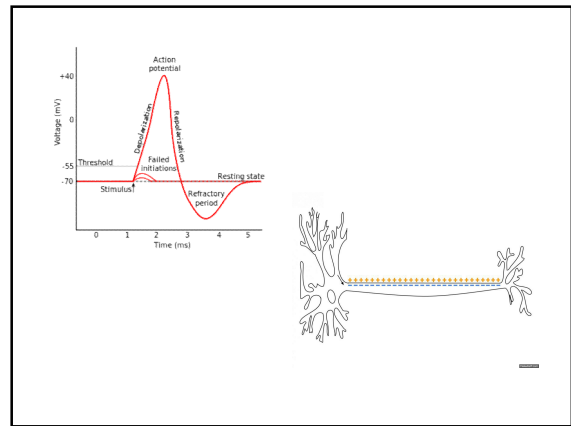

M1-like
 • Neurotrophic factors
 • Pro-inflammatory cytokines (e.g. IL-1β)
 • Chemokines
 • ROS
 • TCS production

Outcomes:
 • Clearance of debris
 • Resolution of inflammation
 • Limited or no damage to neurons
 • Remaining microglia are activated

Outcomes:
 • Chronic brain inflammation
 • Structural damage to neurons
 • Neuronal dysfunction

NATURE REVIEWS IMMUNOLOGY
 VOL 10 | 14 JULY 2010 | 483

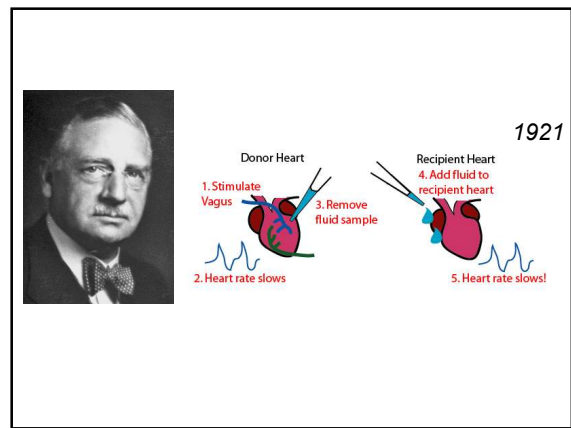

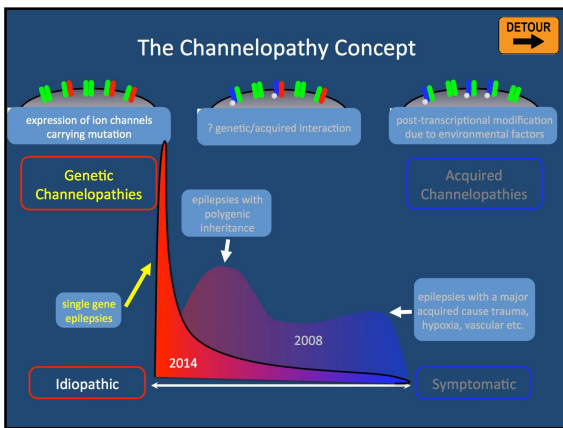

5. Synaptic transmission

'In view of the probable importance of the ... nexus between neuron and neuron it is convenient to have a name for it. The term introduced has been synapse.'

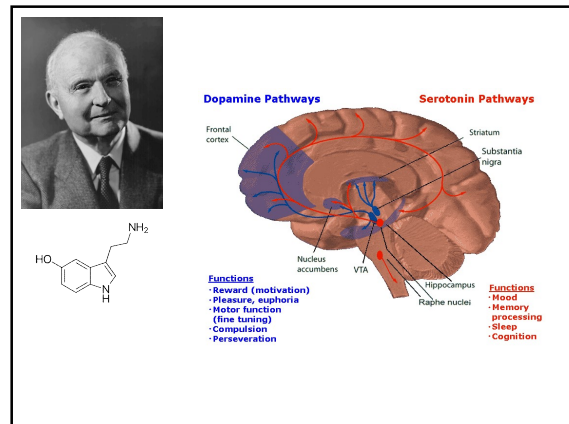

Charles Sherrington, 1906

4. The nervous impulse

TAKE HOME MESSAGE:
– NEURONS PRODUCE ELECTRICAL SIGNALS THAT CARRY INFORMATION –

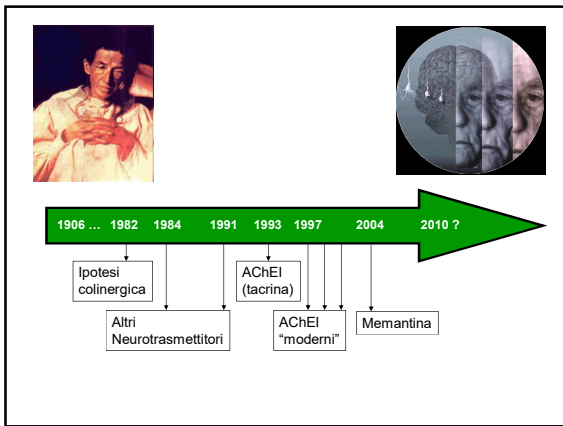

Major neurotransmitters:

- **Amino acids:** glutamate, aspartate, D-serine, γ -aminobutyric acid (GABA), glycine
- **Gasotransmitters:** nitric oxide (NO), carbon monoxide (CO), hydrogen sulfide (H_2S)
- **Monoamines:** dopamine (DA), norepinephrine (noradrenaline; NE, NA), epinephrine (adrenaline), histamine, serotonin (SER, 5-HT)
- **Trace amines:** phenethylamine, *N*-methylphenethylamine, tyramine, 3-iodothyronamine, octopamine, tryptamine, etc.
- **Peptides:** somatostatin, substance P, cocaine and amphetamine regulated transcript, opioid peptides
- **Purines:** adenosine triphosphate (ATP), adenosine
- **Others:** acetylcholine (ACh), anandamide, etc.

6. Sensory perception

'All our knowledge begins with the senses, proceeds then to the understanding, and ends with reason.'
Immanuel Kant, 1787

Neurodegenerative Dementia + Memantine

The diagram illustrates the mechanism of memantine. It shows three scenarios of NMDA receptor activation: 1. **rest**: Normal glutamate binding to the receptor, leading to Ca²⁺ influx and noise. 2. **neuroprotection by Memantine**: Memantine blocks the receptor, preventing Ca²⁺ influx and noise. 3. **Memantine improves plastic processes**: Memantine allows for a **signal** to be detected amidst **noise**, leading to **learning**. A box for **Ebixa 10 mg** (Memantine hydrochloride) is shown.

noise noise signal noise

Danzysz and Parsons, 1999

The senses are the windows through which information about the outside world enters the brain. Each sense organ is specialized to detect data in the form of physical energy, which is then converted into electrical impulses that are sent to the brain, where they are processed and interpreted to generate a coherent experience of the world.

Costandi Moheb. 50 Human Brain Ideas You Really Need to Know

SENSORY INPUT
Sensory receptors are stimulated.

PROCESSING
Sensory information is organised and interpreted, stored and related to previous experiences.

RESPONSE
A response is generated

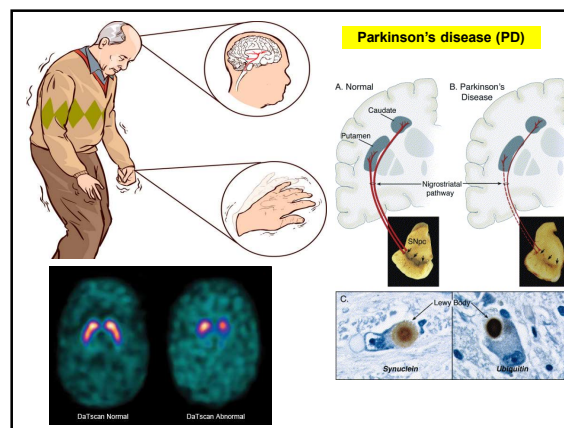

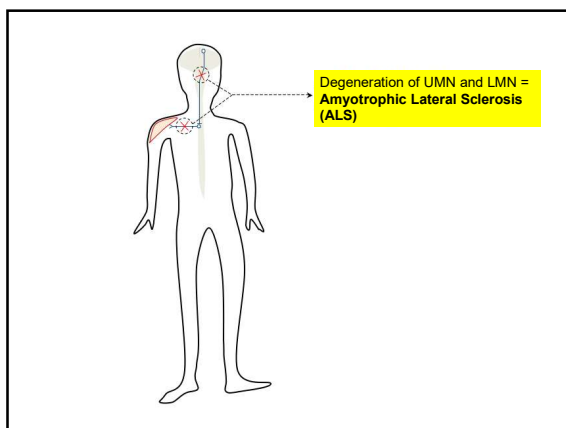

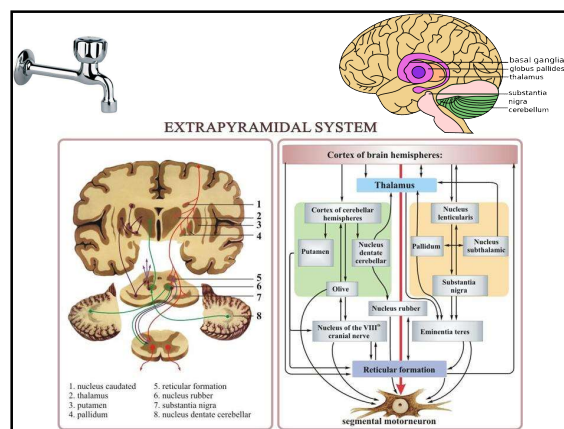

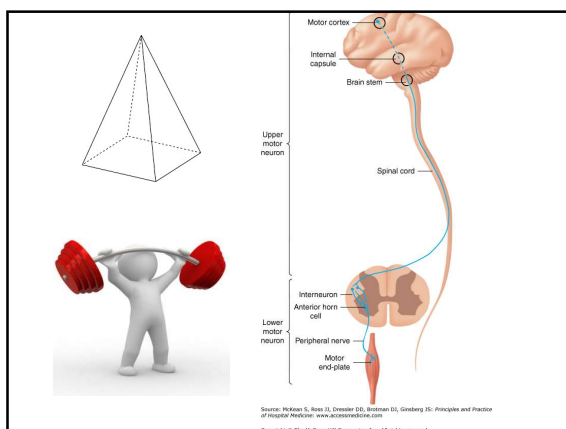

5. Synaptic transmission

**TAKE HOME MESSAGE:
– NEURONS COMMUNICATE WITH EACH OTHER THROUGH CHEMICAL SIGNALS –**

Close-up of the Retina

The diagram shows the eye's anatomy: Cornea, Pupil, Lens, Retina, Macula, and Optic Nerve. A detailed view of the retina shows the Retinal Pigment Epithelium, Rods, and Cones. The Rod structure includes the Outer segment, Disc, Plasma membrane, Connecting cilium, Inner segment, Nucleus, and Synaptic ending. The Cone structure includes the Outer segment, Inner segment, Mitochondrion, and Synaptic ending.

Phineas Gage 1848

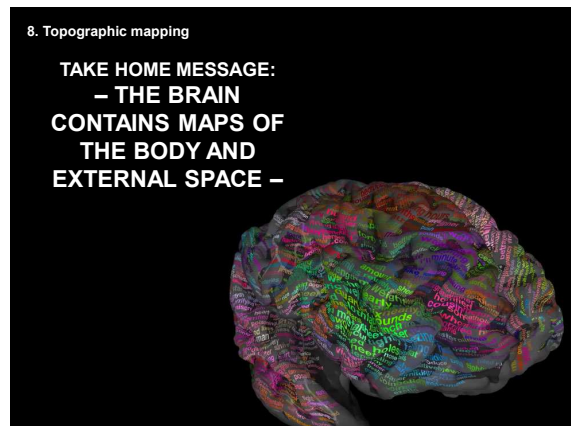

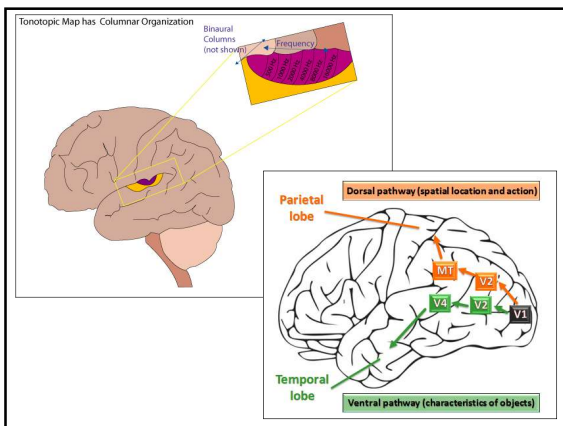

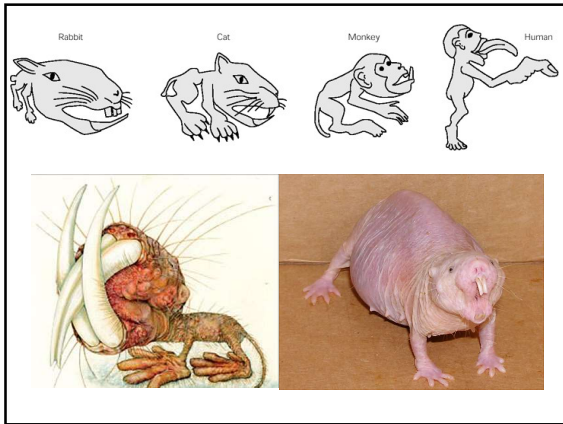

We are well acquainted with several of the leading men in the village where the above occurrence took place, and have been assured by them that the statement relative to the wound and recovery is correct. But that there was no difference in his mental manifestations after the recovery, is, however, not true.

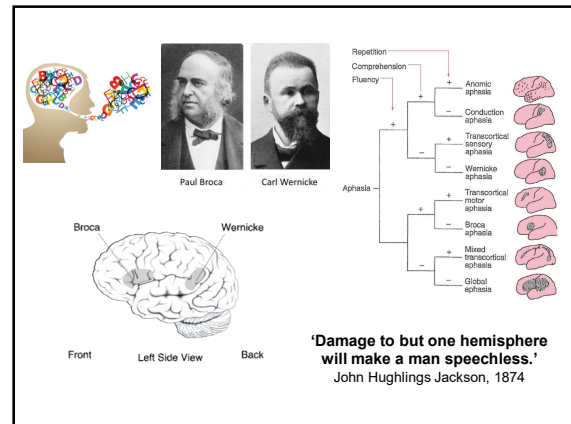

We have been informed by the best authority that after the man recovered, and while recovering, he was gross, profane, coarse, and vulgar, to such a degree that his society was intolerable to decent people. Before the injury he was quiet and respectful. If we remember correctly, the iron passed through the regions of the organs of **IRASCIBILITY** and **VENERATION**, which left these organs without influence in his character, hence his profanity, and want of respect and kindness, giving the animal propensities absolute control in the character. The

Emotion, Reason, and the Human Brain
Antonio R. Damasio

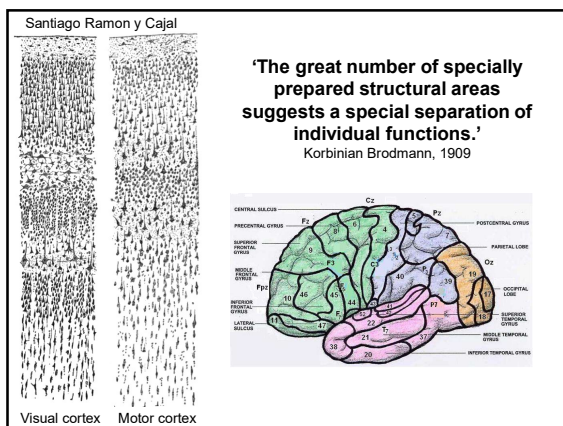

Biological Basis of Memory

Karl Lashley searched for a localized memory trace or *engram*

Found that maze-learning in rats was distributed throughout the brain

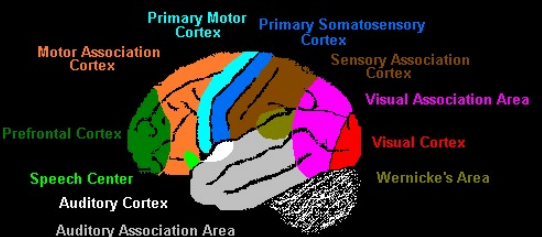

Functional modularity and distributive processing are not mutually exclusive, however. Indeed, the current view of how the brain works is a **combination of the two ideas**.

Neuroscientists now think that the brain operates as what they call a '**massively parallel distributed processor**', with multiple networks working together to generate thoughts and behaviour.

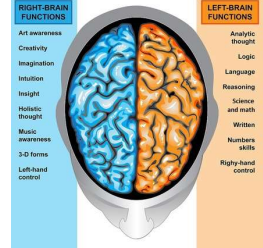

In other words, the brain does contain discrete areas specialized to perform specific functions, but individual specialized brain areas do not act on their own. Instead, each one can be thought of as a **node within a network** that is distributed throughout the brain or within particular regions.

9. Specialized brain regions

**TAKE HOME MESSAGE:
– THE CORTEX CONTAINS
DISTINCT AREAS FOR
SPECIFIC FUNCTIONS –**

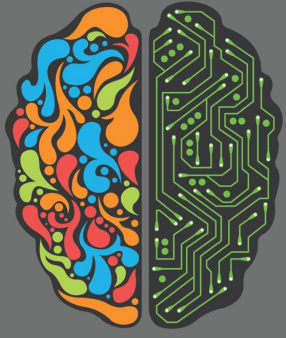

**'There are two brains in the head ...
The one lying on the right side is the
one that perceives; with the left one,
we understand.'**
Diocles, 4th century BC

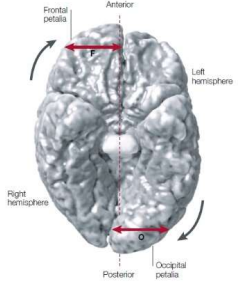

RIGHT-BRAIN FUNCTIONS	LEFT-BRAIN FUNCTIONS

Unilateral Neglect and Awareness Deficits After Right Hemisphere Brain Damage

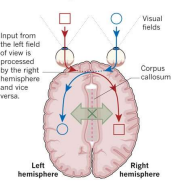

SPERRY (1968)

OF TWO MINDS Experiments with split-brain patients have helped to illuminate the lateralized nature of brain function.

Split-brain patients have undergone surgery to cut the corpus callosum, the main bundle of neuronal fibres connecting the two sides of the brain.

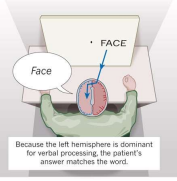

Input from the left field of view is processed by the right hemisphere and vice versa.

Visual fields

Corpus callosum

Left hemisphere Right hemisphere

A word is flashed briefly to the right field of view, and the patient is asked what he saw.

FACE

Face

Because the left hemisphere is dominant for verbal processing, the patient's answer matches the word.

Now a word is flashed to the left field of view, and the patient is asked what he saw.

FACE

Nothing

The right hemisphere cannot share information with the left, so the patient is unable to say what he saw, but he can draw it.

10. Brain asymmetry

TAKE HOME MESSAGE
